The greatest number of memories or the
alfatag characters doesn't interest me.
Has someone tried both side by side?
I ask this because I have read conflicting opinions.
Some say that are not differences and others
that 7030+ is very better.
Very thanks.

Gerry Tods

You are mixing apples and oranges a little bit as the ï¿½more memoriesï¿½
and ï¿½Alfa tagï¿½ is the result of the FPU7030 option.

Specifically the plus unit has added or improved:
IP2&IP3
Lower noise synthesizer
Improved antenna input transformer
Improved IF filters
Optical instead of mechanical encoder for the main tuning knob
Includes the FPU7030 option

If you were to do this I would also go for the NB7030 option. The auto
notch works real nice and the noise blanker sometimes helps.

I canï¿½t help you with a before and after as I bought the radio upgraded.

Looking to trade an Alpha-Delta VRC (manual included, can't locate the original box) in as new condition for an Inrad 2.1 SSB filter for a Yaesu FT-847.

Would be willing to sell for $150, you ship from 11786.

Please contact me off list if interested or if you have any questions.

Thank,
John, KB2COP

I have an AOR7030.....it isn't a bad unit, but after a few years, silly problems show up, such as.....switches that have debouncing problems, a cheap mechanical encoder that seems to have noise problems; this problem could have been cleaned up with an XOR function in the microcontroller. The performance of both of the units is pretty similar, otherwise, unless you are in a very strong signal area. AOR addressed the IP problem by switching to shielded leaded inductors in the front end filters, so IP3 in the transition region is slightly improved. The reason for the improvement is because the original inductors' cores saturated at high signal levels. This change didn't really make any real difference in the midband regions of the filters. I am not sure why they didn't go to bandpass filters the way the other manufacturers chose to do. AOR chose to remove the shielding from the synthesizer, so one of the prominent users (Dave Zantos) observed a problem with "white noise" superimposed on the received signal with the "Plus" model.
On a final note, you can't go wrong with either one. When I phoned one of the distributers, and asked them the differences between the two models, the person I spoke to merely parroted AOR's advertised specifications. In other words, they really didn't provide a satisfactory answer. If it were a choice between the two units, I would probably go for the "Plus" model, because it does use the optical encoder for the main tuning; still, they still use those cheap, failure-prone mechanical encoders for the other functions. It may sound like I have a very negative view of this receiver, but I really don't. I just think that for the price, it should be more reliable. There are two reasons that I am still keeping mine.....first of all, it was a Christmas gift from my wife, and secondly, it is really a fun receiver, with all of those menu functions.

Pete

From: "D. Schmidt" <n9nlu_REMOVE_THIS_@charter.net>
Message-ID: <vioh6jsac4cec8@corp.supernews.com>
Source record: 27815

Does anyone know the specs on this duplexer? Is it capable of doing the 600khz split for a 2 Meter repeater? If not, does anyone have a cheap duplexer they would like to part with that will do the 600Khz split. Nothing all that big needed, I'm only going to stuff 40 - 50W in to the duplexer.

Thanks

Dave

It's a very good deal. Right now the FT-100D is selling for a little under
$1000. I recently paid $650 for an FT-100D and that came with the seperation
kit but no ATAS.

A typical Canadian acting like a stupid American that thinks he has found God.... Most Canadians are true, but some get a little stupid.... What are you a moron.... I can't believe that any other person can think differently of someone because of nationality... But then of course the Americans think they are the best, key word being THINK! Grow up moron!

Rich

>void, and you'll have to finance your own servicing.

I doubt the warrenty was voided by modding it. People mod them all the time for "MARS" and "CAP" use and it's perfectly fine. Since there seems to be only one mod for MARS/CAP, it should be ok. It will also allow you to operate on the new 60 meter band!

Greetings

I am attempting to hook a 706MKIIG to a Ameritron AL-811. Could someone please tell me how this operation is done and what if any relays are required?

I had the amp connected to a FT-840 and used a Yaesu relay for this installation, I assume I will need something similar for this one.

Thanks for your time.

The ALS-500 Manual is on line at URL:
http://www.ameritron.com/ameritron/man/pdf/ALS-500M.pdf

It is dubbed "Instruction Manual". Don't know if Ameritron has a "Service Manual" per se
URL:
http://www.ameritron.com/ameritron/manuals.php

Of note is that the power output decreases 85 watts per volt as the supply voltage decreases from 14 volts to 12 volts -- if I read it correctly. Solid state amps are apparently quite sensitive to power input levels

So measuring the supply voltage AT THE AMP INPUT may be fruitful.

Also they indicate that 70 Watts drive is normally required but up to 100 Watts is acceptable.

I blew a regulator in my IC-706Mk.IIG driving an Ameritron AL-80A. I was using Ameritron's device for isolating the radio from the amp circuitry. It worked perfectly for two weeks and then one day we got a puff of smoke and a lot of stink from the rig. The isolation circuit that Ameritron sells does not use a relay, but instead uses a transistor.

To be fair to Ameritron, I had to disconnect the isolation circuit, move the rig and then reconnect it. It is possible that I hooked it up wrong.

If I had it to do again, I would hire someone to build me a mechanical relay set up and not have to worry about it again. (My vision is declining - diabetes).

I'm sure it's just me, but it's interesting that the complete parts list is in the on-line manual, but not the schematic? I don't own this amp as I'm satisfied with my SB-200 workhorse. But some day I might be interested in a solid-state amp. Having the schematic would help make my decision, or not.

Specs and tuning procedure at db products website:

http://www.decibelproducts.com/pdfs/095060-000.pdf

Says 2 MHz minimum separation.

One of these was just sold on eham.net. Specs listed as 150-162 MHz.

Sounds like no-go for 2M.

I agree Joe, it would be just perfect if I had the schematic, but they do not offer it for some reason in the online manual, and in the manual it has no place where it even hints at adjusting the power output level..... I tried the alc trick and got a little more out of it, but would love to know how you are supposed to adjust the power output, I know they didn't just stick these together and ship them out.....

thanks all!

I used a 706 and an al-811 for several years with it hooked up directly,
with no problems, it is a low voltage relay in the 811, so just run it to
the funky din jack directly.....

I don't remember exactly what pins on the weird jack icom put in there, but
just do a direct connect and it SHOULD work fine.....

might check the voltage to ground on the amp and the current it takes to key
it first, just to make sure..... I have run the 840 into the same amp
directly too... as well as a 746, and 847 a ts-2000 and a 756....

Greetings:

I am interested in locating a source for military AN/PRC 104's. I understand they are available on the consumer market. However, searching the internet, I have not been able to find a dealer or source.

If someone has one for sale or can point me in the right direction to find a dealer, I would be very interested.

Thank you!

Motorola Spectra Transceiver UHF Its on 450 MHz now. Model #
D44KMA7JA5BK 40Watt Comes with Motorola [wire cut] Speaker
/Microphone/Bracket for speaker and bracket for radio. . Works Great!
Scan and alphanumeric diasplay and also do MDC-1200
PTTID Also PL/DPL/etc
Its a 450-482MHz Dash Mount Transceiver. 128 Channels A5 Head
Price: 175.00 As Stated Works GREAT!!
ritchi50@optonline.net

1972. Mobile Icom 706MKIIg shielding problem ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-03 23:25:56 UTC
From: jdolson@iserv.net
Message-ID: <6cb45ec9.0308031525.45c4bb1d@posting.google.com>
Source record: 27846

Last year I operated my Icom 706MKIIg HF mobile with no problems.
I've taken the HF antenna off and installed a 2m antenna.

With the front panel attached to the main body of the transceiver,
everything works FB.

However, when I remove the front panel and put it between the two
front seats, keying up on 2m causes what sounds like feedback - a high
pitched squeal coming out of the speaker. Talk into the mic and I can
hear myself on the radio speaker quite nicely.

Does it sound like a shielding problem with the separation cable
between the radio and the front panel? I'd be surprised simply
because I can't find any reports of this problem on the net.

Suggestions?

Thanks,

Jim
jdolson@iserv.net

Not seeing a schematic, I'm just shooting from the hip. But I would expect that if the output is way down, I would be looking at something like a final transistor is defunct. I doubt there are anything to be adjusted as they normally use broadband construction and design. It should just 'work'.. I can't imagine there is just one transistor (FET) in the final. Have you tested them? Of course that's not to say the previous owner didn't change components to drop the power. But frankly, there are easer ways to run less power.. Like less drive..

Speaking of deviation meters, can anyone recommend a freeware Windows sound card oscilloscope program? I'd like to be able to run the line out audio from a scanner into the sound card and be able to display the audio envelope. The amplitude scale wouldn't need to be calibrated as long as I could count the number of divisions, I could compare the peak deviation from the 252 to other signals on the air. A quick and dirty deviation comparison checker. I use Scanner Recorder to record the audio, and it has an input display like I want, but no graduations to use for comparing the amplitude from different mics and radios.

I have a Turner desk mic connected to the 252 at the moment. I don't really know if It's an improvement or not. I built a little adapter box with 6 push button switches so I can control the radio, but I have to do without DTMF. Not a problem locally.

Could also be poor shielding in the vehicle. But remember the cable that links the radio head to the radio is very small, so there can't be too much shielding in there.

In the AES catalog, the 100 is discontinued and $270, the 120 is $330.
Contact Yaesu if you need more info, or do your own research on
Google.

Otherwise, you might make sure the ft100d wasn't screwed up when it
"was taken out of band." If nothing else, the warranty is probably
void, and you'll have to finance your own servicing.

From: gus <gtreewater@sbcglobal.net>
Message-ID: <96hriv4ks4iunl03n5pgj65285snevhiqp@4ax.com>
Source record: 27851

I turned on my TSB-2000 today after not using it for awhile and it has a problem. I was attempting to used the computer software, and since it had been awhile and I wasn't sure of the settings, I thought I'd return the radio to factory default by hitting the reset button on the front panel. Big mistake. The RC-2000 control head no longer functions or even turns the radio on. Turning the radio on with the power up button turns the power up light on, the fan starts and runs for about 2 seconds, a relay seems to click and then nothing. The power up light remains lit. I tried a different power supply. Any other ideas?

Make sure you have the ground screw for the extension cable installed
at the radio end. Causes lots of problems if it isn't installed.

Source record: 27857

A friend has an AL80B (bought new) and is on his fourth 3-500 in two years or so. It just developed a grid-cath short. Supposedly there was a batch of tubes that were prone to go bad, but the latest ones from MFJ are supposed to be ok. Apparently not or something is wrong with the amp. He's a good operator and seems to be tuning and operating within safe limits for the AL80B. The latest tube is an Amperex as was the first ones in the reported bad batch. He reduced the filament voltage last time from 5.7 (from the factory) to about 5 before the present tube was installed.
Any ideas?

Comment On This News Group

There is a lot of good stuff here, but also an incredible amount of junk.

Another place to reasonably discuss Amateur Radio is at the Yahoo Groups.

http://groups.yahoo.com/

Search for "Amateur Radio" get over 1200 places to discuss your interests, mostly without flames, insults, off-topics, false information, and the stupidity that is prevalent here.

Lots of Elmers have left here and are now on Yahoo Groups.

Just FYI

GW, What makes you believe we can't speak our minds? I can freely discuss topics like marijuana with employers without worrying about being fired. I can say I'm opposed to gay marriage without being locked up. There ARE restrictions on inciting hatred (as an example) which happens quite often anyways, but everyone has their day in court and you are free to think what you want.
As well, we can still own guns- you just have to get an F.A.C. (Firearms Acquisition Certificate) or whatever the government is pushing towards now. When I left the military I thought about getting an FAC just for the hell of it, but what would I use it for? Perhaps hunting, or if I lived in the rural areas (I'm from Alberta) protecting your livestock from coyotes, wolves, etc. In the city, that's not an issue.To protect ourselves on the street from criminals, we just don't need them. I hope that the reason Americans own guns is merely to assert their constitutional rights and not out of fear of walking down their own streets.
Yes, we have a lot of illegal aliens here and so do you, huh hombre? I know that you are trying to make a 9-11 connection here but you are beating a dead horse-and you know it. It's not up to Canada to determine who enters the United States, and it sure wasn't Canada that gave them flight lessons. Hopefully in the near future, you should be able to leave "the land of the free" on a vacation and smoke a nice LEGAL joint without fear of persecution. Perhaps you will eventually get similar freedoms in the States but until then our door is open, no hard feelings eh?

Going by memory.....you have a switched bias circuit in that amp. It comes on and off with voice peakes. Enables a cooler operation. That circuit is having a problem. Ive heard of this before. But since I don't have an amp like that I can only go by what I remembered.

I stand corrected! A little bit of web research shows that this would be a venture capitalist's dream. I have to continually remind myself not to overestimate the golden-ear crowd -- after all, the gold-plated 8 ohm characteristic impedance speaker cables sold (and I assume still sell) like hot cakes. The placebo effect is certainly powerful, but it's possible that the "quantum purifiers" might actually do something. Rather than believe that the purveyor is actually selling components whose composition is "classified by the U.S. military", I'd be willing to bet they're some sort of more-or-less off the shelf varistor. That would flavor the music a bit, and anyone who'd just dropped 600 bucks for a pair of them would no doubt find the flavoring to be marvelous. A few minutes with a curve tracer and some web specifications should pin the source down pretty quickly. But I'm not quite 600 bucks curious. . .

Hello All,

Kenwood has made a new transceiver.

It has HF & 50Mhz.

There are two models: 100 watt & 200 watt.
The 100 watt model has a built in antenna tuner.

A picture, and information is to see at:

http://www.qsl.net/pd0rkc

73's Cor (PD0RKC).

I do not want to get into an argument over a Pussy goverment that does
not allow their countryman to have handguns. I am DAM GLAD that
I live in a country where I am given the means to Defend myself..
Because you have the same type of idiot in canada AND all you can
do is yell cop. Would not you feel more comfortable with a handgun??

"when guns are outlawed, only outlaws will have guns"

Just My Opinion..

Bob

Mr. Mcferrin,

You sir are a prime example of why the world is going to "pot". You
simply refuse to believe that a new Christian would want to make
amends for all of the wrongs that he has done in the past. I am not
going to be number one on the
Darwin awards simply to piss you off.

Jesus was not an alien. I have it on good authority that he had two
arms and two legs just like you guys. But I think he had bigger balls.
He didn't hide behind a gun, he used his flame thrower that he kept
hidden under his cape. You know the "hell fire" that the Bible talks
about. I mean come on, how can you possibly think that he had big
bugger eyes, had grey skin, and flew
around in a saucer. Good grief. Thats quite a fairy tale.

The ATAS-100 has the accordian style shroud over the top of the loading section of the antenna. The ATAS-120 has been redesigned to eliminate the shroud thereby eliminating the problems for those of us in cold winter climates.

I have the 100 (not D) with both CW filters and tone board and love it.

Sorry I press send too early, The 5.7 volts on the filament will eat tubes in a hurry, also, (In the Dark) look for plate choke shorting out,
I find weak points are the Bias circuit and the Bandswitch. I see many of them that come in for repair with these being the most common problems.
But the 5.7V is a good start, I just can't see tubes being all bad. 73 Chris VE3NGW/W4 Florida

My AL-80A (the same amp, really) is still on its first Eimac 3-500Z tube. I bought it ten years ago last Spring. I am still getting rated output without any problems of any kind with the amp. I love it.

Ed,

I have the AL80A also in fact a early version without the step start
which I have now installed myself. What kind of output power do you get
out of your AL80A? With mine I can usually get 1 KW, but I don't like
to push it so I keep it at 800-900 and it seems to be ok at least for
ssb. By the way mine was made by Prime instruments, it actually looks
pretty well made with a nice looking transformer and two blonds inside,
hi.

Fellas,

I had the same problem except on HF (20 Meters). Anytime I tried to
key up there the rig would act wierd and promptly shut off. I suspect
that you have
RF getting on the the separation cable. I simply wound 6 turns of the
control
cable onto a wooden dowel (3/8") at the transceiver and used on of the
Rad. Shack ferrites at the control head (I was trying to keep from
buying 2") Anyhoo, it worked. I think just a bit of experimenting with
your control cable
will fix your trouble.

Since ANYTHING has power moving thru it will generate heat that will have
to be removed from your -273 degree (0 Kelvin), what do you propose for a
refridgerator to get rid of THAT excess heat?

Here are some of the claims:

"Bybee Technologies claims that the quantum filtering provided also
speeds up electrons by as much as 50% and in the process selectively
removes undesirable ones, thus purifying the remaining signal."

The review this was taken from (SoundStage!) then goes on to tout the
"damping characteristics" of the wooden box the device is housed in.
I'm curious about whether the reviewer might also happen to write for
the Weekly World News.

Reminds me of the blind man selling pencils on the street corner for
$10,000 apiece. He claimed he only needed to sell one.

The American Comedian George Carlin put it all very well.

Here is what he said:

"When it comes to bullshit, big-time, major league bullshit, you have to stand in awe of the all-time champion of false promises and exaggerated claims, religion. No contest. No contest. Religion. Religion easily has the greatest bullshit story ever told. Think about it. Religion has actually convinced people that there's an invisible man living in the sky who watches everything you do, every minute of every day. And the invisible man has a special list of ten things he does not want you to do. And if you do any of these ten things, he has a special place, full of fire and smoke and burning and torture and anguish, where he will send you to live and suffer and burn and choke and scream and cry forever and ever 'til the end of time!"

"Environmentalists estimate that, at the present rate of consumption, the world will have depleted its present supply of bullshit by the year 2005. Increasingly, synthetic bullshit is seen as the only answer. Therefore, the leading religions, in cooperation with big business and the major political parties, are working hard to beat the deadline."

"Who can I convert?" "Let's go to this country and make them christians." "Wear this." "Do that." "No, don't worship that way. Worship this way or I'll kill you - for the good of your soul, of course." Meanwhile, followers of Eastern religions are sitting in the middle of their minds, experiencing a bliss and a level of consciousness that Western man can't begin to approach. Christianity is all external, all material. Gold. War. Murder. The big churches operate, morally and economically, just like the big corporations. Yet they don't pay taxes. Let them pay their fair share, those fucking religions."

"And the belief that there's a man in the sky watching us, watching everything we do, is so ingrained: First thing they do is tell you there's an invisible man in the sky who's going to march you down to a burning place if he doesn't like you. If they can get you to believe that, it's all over. Before you're six years old, they've got you thinking that, they've got you forever on anything else they want. There's no real education. It's an indoctrination training little producers of goods who will also be consumers of goods. Some will be on the producer side, and more will be on the consumer side. But you're all being trained to be a part of this big circle of goods being pumped out and everyone buying them and everyone going to work to help make more of them for other people to buy."

greetings Dave:

since you have the extra gear you are giving away, why not send me a radio to replace my 756 you got,.. my address is still good on qrz. so, send me , heck, just about any radio, as long as its decent, and working and we will call it even, and a lesson learned.

N5XXM, Ken.

2049. Is the IC-V8 type accepted?

Newsgroup: rec.radio.amateur.equipment

I read somewhere that the IC-V8 is type accepted for use out of band. Does anyone know if this is true? Does the FCC have a database of type accepted radios?

If you were completely paranoid like gw, probably yes. There is little need for "protection" if the crime rate is low. Besides, what makes you think gun ownership is illegal in Canada? You don't think that mental case knows what he's talking about, do you?

NO! BUT I can remember going over to canada many times and if I were
lucky I would get a customs agent who new how to fill out the paper
work to take custody of my handguns until I came back to the USA.

They were not very knowledgeable about the custody form. They would on
occassion try to sneak through the form that says you are surrendering
them to the Crown.. Screw the crown.

If you guys are lucky they may let you keep black powder muzzel
loading Long guns.

Like Sheep to the slaughter.

Back in the 1930s or 40s a federal law was enacted that made Automatic
Weapons a federal offense to possess without a 3rd class firearms
dealers license. MANDATORY 20 year sentence for possession without
the license. Any Felon can go to Miami or Toronto and within 24 hours
find somebody who will sell him an AK47, FULL AUTO.
FELONS do not care about Anti Gun Laws.. and the canadian goverment
won't even let you have a handgun for self protection.

Your goverment must be composed of gutless frogs like the cowards from
their homeland who wussed out when we went after the Iraqi's..
After the war they want to run things. Screw them..

Just My Opinion

Bob

>Fight Spam! http://spamcop.net
>National "Do Not Call" Registry: http://donotcall.gov

No it is not Type Accepted for use out of band. Only the receiver is
accepted not the transmitter. The FCC ID is AFJIC-V8

go to this page
https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

put afj in the grantee code box and IC-V8 in the product code box.
Then click on the submit button. You will get the Grants for both the
IC-V8 and IC-V8000.

For the IC-V8 to be Type Accepted it had to have an Equipment
Authorization under FCC Part 90. All you will see is authorization as
a scanning receiver from136 to 144 and 148 to 174 MHz. The
transmitter was not tested nor authorized for Part 90.

So it is not Type Accepted for use in the commercial radio services,
might be ok for MARS and CAP though. The NTIA supplied equipment
authorizations for MARS, CAP and most all other US Government
frequencies.

Amateur radio transmitters must only meet the technical standards of
FCC Part 97 amateur rules, therefore only tested by the manufacturer
where receivers that operate above 30 MHZ must be Type Approved under
FCC Part 15 rules for radiation of products and are certified for
those rules generally by a testing lab. Then the receiver is only
tested for FCC Part 15 at the frequencies the manufacturer decides to
have it tested at.

Thanks for all the replies. He fixed the fil voltage before this last tube was installed and it lasted about 4 months. Maybe he should have the bias ckt checked out. These were all Amperex tubes and MFJ said there was a "bad batch". The last tube was supposed to be after that, but who knows. Certainly does point to something else tho.

The grid to cathode short is a clue... You might want to review the
parasitic issues with this and similar amplifiers. A parasitic "bang"
might be the source of this and or similar problems.

Have a look at Rich Measures (ag6k) web page... used to be at
http://www.vcnet.com/measures but is now moving (or has moved to)
http://www.somis.org

There are protections for grid to cathode shorts in 3-500z amps. I like to
use a proper triple bypassed grid resistor and have never had grid/cath
shorts in any amplifier with said after an upgrade to the parasitic
network(s).

If you have questions, you can contact me through the sonic server Email
icons or review Rich's web page and he will also reply to Emails.

cheers and good luck
skipp

Hi all

powering up my 732 today , I had a problem
the only yhing I see on the display is "42"
Anybody ideas
Maybe it's the backup battery , I opened the upper and bottem but I didn't find any battery
Anyone knows about a hard reset for this

73's

I doubt it's a parasitic, but if you want to explore that, Measures has
his special parasitic kits for sale on his website.

Cheers as they say
Dale, K9VUJ

2077. IC-746 driving a Drake L4-B

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-06 20:21:36 UTC
From: Jim McDermott <jimcderm@comcast.net>
Message-ID: <4uSdnblB9oXM_qyiXTWJiQ@comcast.com>
Source record: 27750

Just picked up an Icom 746 to give my TR-4 some time off. This 746 doc isn't too clear on connecting it to an old amp like the L-4B. How do I handle the keying voltage difference? Are there any other things I need to mod to drive this old beast?

Thanks!

Jim

K9GOX Estate Sale - Southern ILLinois
Many many items for sale No Shipping!
Kenwood TS570D Fine Shape With Cw filter,optional mike AND Voice module- $550
ALS 600 Amp - $650
Many other bargains like this..

There will be a mini-hamfest and general yard sale at K9GOX (Mel Skelton\'s) residence in Jonesboro, IL. this Saturday morning, August 9th, beginning at 10:00 A.M. The remainder of Mel\'s stuff will be for sale, and several local hams will be bringing items for sale.

You are also invited to bring anything you want to sell and join in the fun.

Directions: Mel\'s house is at 104 South J street, in Jonesboro, IL. J street is the first road to the South, West of the Jonesboro town square, on state highway 146. Highway 146 runs East & West through Anna and Jonesboro. We will be monitoring the 146.250/.850 Mhz repeater for help if you get lost.

Bring some stuff, and some friends and enjoy the first and last Jonesboro hamfest.

NOTE:There will be household items on sale for the ladies also.

2082. RF in shack and ground question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-06 23:41:10 UTC
From: gil <gilpi@mindspring.com>
Message-ID: <bgs3d7$l30$1@slb9.atl.mindspring.net>
Source record: 27755

Just recently started to use an MFJ artificial ground and comparing it to a ground rod thru the basement's sump where is always wet.
My antenna is an end fed about 50 feet and I use no more than 30 watts (CW)
While switching between grounds I noticed my field strength meter droped to almost nothing while using the artificial ground with a wire on the floor, when switched back to the ground rod the field stregth meter went way up, all using the same wattage.
So the questions....when the meter reads low does that mean less RF in the shack and more juice to the antenna?
And a high reading the opposite?
Would love to hear comments/advice.

Thanks...gil

2083. Re: RF in shack and ground question

Based on ur description I would say your 'field strength' meter is working
well. You can take that meter and move it to various places in/out of the
shack and get various indications. It is measuring the FIELD just fine.

What it means is anyones guess.

Dan/W4NTI

What's that got to do with anything? No country in the world will let you
bring in weapons as a visitor, much like visitors to the US are not allowed
to carry weapons.

As I pointed out before, gun ownership is perfectly legal in Canada. Don't
make up stuff as you go. As far as felons buying AK47's in Miami, when was
the last time you or anyone you know was assaulted with it? An overwhelming
majority of assault and property crimes are committed with simple or no

weapons. The AK47 parable is an NRA bedtime story for little DC congressmen.

> Your goverment must be composed of gutless frogs like the cowards from
> their homeland who wussed out when we went after the Iraqi's..

"You" went after the Iraqi's (sic) only because that was the order that came from Tel Aviv. Wolfovitz and Rumsfeld arranged it and Cheney and other assholes got rich(er) on the deal. Ordinary Americans got fucked in the process and young boys are still dying there as a result of the bullshit propaganda about a Nigerian nuclear connection, non-existing WMD's, alleged and laughable imminent threat to the US and a made up Al Qaeda connection.

> After the war they want to run things. Screw them..

You think there's going to be anything similar in North Korea which actually *is* a threat to US security, unlike the stupid-ass Ude and Kuse? No fucking way - they're not a threat to Israel.

Dave, get a clue! YOU posted HERE at ADP, not the other way
around. The "wierd messages" you refer to were, therefore, earned and
deserved. As both a fellow ham radio enthusiast *and* cannabis smoker,
I do know what your "free gear hamfest" comes across as. One word.
SPAM! You've probably been plonked by other amateur radio operators in
the ham newsgroups as well as here at ADP.
In short, you broke a few cardinal rules of Usenet; don't post
personal information and don't post off-topic! Yes, I am well aware
that a quick trip to www.qrz.com will yield the name and address of
anyone who posts their ham callsign (notice I don't post mine, for
obvious reasons!), but that fact is known to few others outside of the
hobby of ham radio and shortwave listening.
So, my advice to you is skip posting ham radio articles to
alt.drugs.pot. You don't see me posting articles on the ham groups,
like "I irradiated my Sensimillia crop with 1294 MHz at 1 KW and
produced the most potent strain of pot known to mankind!", so just let
it go, Dave. Post in on-topic groups. And don't forget, Dave, I walk
among you. I've been licensed in both amateur radio, and commercial
radiotelephone (broadcast, radar, and FAA endorsements) for more years
than I care to recall. I've also been a cannabis activist for a long
time, as well as a frequent smoker for both recreational and medical
reasons.
To my fellow amateurs who have read this post, my apologies if
my off-topicness has upset anyone. This post is to show Dave the error
of his ways in the most friendly and direct way possible. I'm sure he
has learned a valuable lesson today and will go forth and sin no more.
To my fellow smokers here at ADP......well.......smoke 'em if
you got 'em!
73 es cul,
BudBurner N9???

Hi, Does the 732 have a removable display that you can remote it?
I have 2 TM-733A with the remote face.
On occasion the display is all screwed up and the radios won't work.
The cure for this is to take off the display. There are a few small contacts on the main unit and small spring loaded tabs on the display. When the radio is connected these make contact. Just lightly rub both sets of contacts to clean them a bit and put it back together. If that is the problem, this will work.
good luck, Mark

Yes a much better newsgroup for old vacuum tube questions is
rec.antiques.radio+phono

Also try the tube vendors at URL:
http://ac6v.com/components.htm#V

And possibly URL:
http://www.sarrio.com/

Good Luck

I sold my ft920 to my friend and he accidently hooked up the power cable in reverse.

Has anyone seen this, and if so, what kinds of problems can we expect to find?

Is ther a diode or fuse installed to accommodate this error?

Where would you expect to see the problems?

Thank you all,

Mark.

Most ham gear has a reverse polarity protection diode. This will usually pop the fuse, but you will have to replace the diode, and perhaps repair board traces.

Sorry, but whats so complex about a 1 tube amplifier - if you have an amateur license, you should have the theory to check it out - the procedure for parasitics etc has been in the ARRL handbook for about 30 years or more - a voltmeter can be a useful instrument if its used to check the specifications of the amplifier - and if it is playing up, how do you know its not spraying garbage all across the spectrum? - have you checked? -

2101. FT-817 CW Keying Question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-07 15:23:25 UTC
From: K7MEM@myrealbox.com
Message-ID: <eed95b3d.0308070723.652b2851@posting.google.com>
Source record: 27774

I am trying to help a friend with his FT-817. He is trying to hook up a keyer to the unit. The manual shows a picture of the proper hookup for a straight key/keyer and for a set of paddles, to use the internal keyer. The straight key/key hookup shows a 2-conductor plug and the paddle hookup shows a 3-conductor plug. All this makes sense and the keyer cable was wired to a 2-conductor cable. However, it doesn't work. The keyer keys other units just fine.

But if you go to the instructions for enabling the CW mode it specifically says "3-conductor plug" in the section for a straight key/keyer. This conflicts with the hookup diagrams. Which one is correct? Should he be really using a 3-conductor plug for all hookups? If so, where should the wiring go?

I have not had access to the FT-817 yet so I don't really know if my friend is setting it up correctly, but I am still curious about the discrepency in the instruction manual. It may be that he just didn't set it up right and this is a non-issue.

Any help?

Martin

If you really want to be the envy of all your friends, go to a hearing specialist in your area and have them order you a wireless one - it fits in your ear like a tiny hearing aid - you can hardly see it. It has a bluetooth transmitter that connects to your headphone jack on your radio. It transmits to the hearing aid so you can be listening to your scanner or ham radio and no one will know! Great for church! I'm just kidding...sorta.

Re: Kenwood kpt-50 repeater and radio programming unit

Hello there,

I've got one Kenwood kpt50 repeater / radio programmer unit for sale. The kpt50 works as a stand alone unit (has a keypad and a display) or with your pc and associated software via a standard rs-232 serial comm port.

This unit programs the Kenwood TK and TKR-720 / TKR-820 series repeater, base and mobile radios. It will also do (some of the) other similar Kenwood models.

This unit is probably my last one for sale. I sold them on Ebay earlier this year for various amounts up to $239 each. This is an original kenwood unit and yes I'm an Authorized Kenwood Two-Way Radio Dealer - Service Center and would be happy to supply any two-way radio - parts needs you might have. Drop me a note if you have any Kenwood Two-Way question.

This is a previously used unit, started life as my personal kpt50, lent it to "a friend" who had it over a year to program one "quick repeater job". Got it back just a short time ago. I will put a full new equipment warranty on it and provide copies of all the proper programming information. I had to use my last inventory unit in place of this unit while it went on vacation with my friend. Now it's back and I have one unit extra.

I used to program the tkr-820 (and 720) repeaters by hand using this type unit, but forget that... this unit has the normal rs-232 pc port access which allows you to do everything on your related laptop and save the data in regular archive files. Much nicer... I'll include a regular copy of the pc software with the unit, not bad.

Now the price, set below actual Dealer cost at $165 plus actual shipping, figure maybe $5 for USPS Priority Mail.

OK, that's about it. Drop me an Email if your are interested. If no one responds within a week or two, I'll toss it up on Ebay. Don't be confused by the "clone units" often listed on Ebay. Some of the associated programming units don't work on all the models. I know because I bought one myself before I became a Kenwood Dealer some years ago.

This is an original Kenwood made KPT-50 programmer.

That's about it, remove the NOSPAMPLEASE from my email address if you want to drop me a related message. My ebay ID is over 700 actual... all

positive feedback so I hopefully must be doing something right.

Thank you for reading this post.

cheers
skipp

skippNOSPAMPLEASE@pilot.ucdavis.edu

Remove the NOSPAMPLEASE else I'll never receive your message.

You can buy or build a keying relay to put between the radio and the AMP or you can just order a Heil Dual Footswitch that will key the radio and the amp at the same time. If you click on this link http://www.k5joe.com/page3.html and go to the AL-82 Amp, click on that picture and you will see the little Ameritron Amplifier Relay Buffer switch that you can buy. You do not want the voltage of the amp to get into the 746.

As I mentioned before, a big clue is given in the grid to cathode short description.

It takes a heck of a lot of energy to make these tube elements repeatedly short. A parasitic bang is just such an animal.

Rich not only sells the kits cheap, but he provides the information to "roll your own" on his web site.

Ah come one guys -- he IS asking for advice as to how to repair the beast.
Why give em the old timers drill?
30 years ago many Hams were RF technical by occupation or the military.

Things and times have changed -- many are opting for the computer field.
Less and less RF savy in the Amateur Radio Service today and that is OK.

But when they come on asking for help --- you can Elmer or Bash --- the
choice is yours, but you know which one is correct in the spirit of Amateur
Radio

A refresher course inTHE AMATEURS CODE by Paul M. Segal, W9EEA (1928)

The Radio Amateur is:

CONSIDERATE..... never knowingly operating in such a way as to lessen the
pleasure of others.

LOYAL..... offering loyalty, encouragement and support to other amateurs.

FRIENDLY..... with slow and patient operation when requested, friendly
advice and counsel to the beginner, kindly assistance, co-operation and
consideration for the interests of others. These are the hallmarks of the
amateur spirit.

It actually makes no difference whether he uses a two or three conductor
3.5mm plug. Just ensure that the '817's internal keyer is disabled using
the menu, and ensure that your keyer is configured for normal, positive
keying and not grid-block keying (it probably is already set correctly
as grid-block keying is very rarely used nowadays).

Hi all,

Picked up a 2nd hand Daiwa CN-410m crossed needle SWR
meter the other day.
I want to re-calabrate it and check it out.
Can anyone help with a circuit diagram or know where I
can get one from?
Maybe the original manual had it in?

Tnx and 73

Hi Gil
The best way to answer your question is to go outside and have the field strength read from the antenna while someone inside switches the grounds inside.

Jim : Go to Radio shack. Get a small 12V relay with external contacts that close when relay energized. Use the 7 pin DIN connector and put pin 1 (12v) and pin 3 (ground on xmit)to the relay coil. On xmit you will be keying the relay which in turn keys the linear. The relay output of the RS relays will tell you what amp capable of handling. Most are good for up to 2-3 amps and up to 24 volts from a linear, in fact can key 110v linear relays OK too if about 200ma or so.. These relays are cheap. Do NOT buy the Icom device, you will pay $25-30..

.35 watts. Put it into a 3db gain antenna with no-loss feedline,
and it will seem like .7 watts.

If it's a VHF/UHF HT, go find an HTX-420 (19-1108) for $130.00.

Gun, handgun, what's the difference? You can have either or both - they're all legal. What's your fucking problem, anyway? As if a measure of personal freedoms in a country is measured by the amount of thermonuclear weaponry a person can legally own.

What about drugs in the US? Can you legally own ten ounces of Marijuana? No? What about heroin? No? LSD? No? Of course, these are all "bad" and "evil" just like alcohol was in the Al Capone days. Or so your politicians want you to believe. Well, guess what... if you're not free to inject a substance of your own choosing into your own goddamn vein, you don't have much of a freedom, do you? Forfuckssake, even a consensual sex between two adult fags was a crime until a few weeks ago. Prostitution is illegal. Patriot Acts I and II are taking away your personal liberties as we speak. And you keep harping on handguns. Ts, ts, ts...

Point taken, and I readily concede that he is asking for help, and
hopefully from the replies he will be able to work it out.

Three
"The Amateur is progressive...He keeps his station abreast of science.
It is built well and efficiently. His operating practice is clean and
regular"

Thats from the 1961 ARRL Handbook - (no paricular year chosen, it was
grabbed out of the bookcase at random, and no, I didnt buy it new....)
I think its still relevant.

It seems to me that this problem has been going on for years -
consumed many tubes, and doesnt seem be solved except by "blaming"

someone - either MFJ, Eimac, whatever.

IF you have an Amateur license and IF you want to operate QRO then there is a commensurate(sp) responsibility to be able to do that WITHOUT causing harmful interference. That is in the terms and conditions of your license. Fair enough, you can pass the exams on crib sheets without any theory - but for heavens sake, this is SUPPOSED to be a technical hobby!.

Buy a ARRL handbook, read the section on amplifiers, borrow a scanner and see if its radiating anywhere else - not really high tech stuff, just BASIC rf knowledge that is supposed to be a precondition of getting a license.

In the interests of a good argument,

de VK3BFA Andrew

I get totally pissed off when 2 amateurs, probably a few hundred miles apart, insist on running QRO on 80m so they can chat to their buddies in armchair comfort - wind the receive RF gain back to eliminate those nasty atmospheric noises, and stuff the rest of the world trying to have a QSO beneath them.

That's what I would think. I will have to double check the configuration.
That's got to be where the problem is. Thanks for the feedback.

Do you mean an old Kenwood TR-2500 HT? I know where
one is that seem to work, though not as good as a new radio.

I have the complete service manual, schematic and user's guide
for that radio scanned in.

A real clean Drake T-4XC transmitter.......$240 plus shipping

This unit has been checked out and works well putting out 90-110 watts
on each band. It has the crystal for 30 meter operation installed. The
unit is very clean both inside and out with a few minor scuffs to the
case. Includes the original manual. The AC-4 power supply has already
been sold.

Photos:

Heathkit DX-40ï¿½ï¿½ï¿½$75 plus shipping
Good front panel, case needs repainting, has the crystal door. Wiring is
clean inside and all of the tubes are good. Has the correct
knobs on the front. The transmitter appears to have a blown power transformer
but includes a non-Heathkit replacement which is rated 600 volts CT at
200 mA. Includes a photocopy of the manual. Although not shown in thre
photos, I have added the correct gray knob to the crystal switch on the
back.

Might sound silly but you do have it powered up?

You would be surprised at how many called me while I worked at ICOM
trying to program the user programmable ID in the IC RP- 4020 repeater
thinking the internal lithium battery was supplying the power for
programming. I will go on to say I don't remember if the user manual
ever specified the requirement to power those repeaters up for ID
programming.

Not knowing much about Yaesu I see it uses a special programming
cable. Maybe it has a level convertor housed in the DB 9 or 25
connector. Quite possibly a componet has gone bad if it has such a
level convertor.

> Part 47 Section 2.815 of the FCC rules make it unsuitable to sell or offer
for
> sale in the US.

2.815(e) The proscription in paragraph (c) of this section shall not
apply in the marketing, as defined in paragraph (c) of this section, by
a licensed amateur radio operator to another licensed amateur radio
operator of an external radio frequency power amplifier if the amplifier
is for the amateur operator's personal use at his licensed amateur radio
station and the requirements of Sec. Sec. 97.315 and 97.317 of this
chapter are met.

Not clear to me the amp would be unsuitable for CW operation,
if operated properly and harmonics filtered.

Please see my Drake TR7 Transceiver up for auction, ending today. This is a nice late SN unit that has been gone over by John Kriner, the Man Electronics. It has all of the filters, the latest mods and looks and works great. See at:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3039149998&ssPageName=ADME:L:DS:US:8
Thanks, Charlie Hugg, K5MBX

Hi Jerry,
If still available, what are you asking for
the radio?
Thanks,
Bennett

2161. Re: "Muffled" HTX-252 Transmitted Audio

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-09 15:58:45 UTC
From: fmmck@aol.com
Message-ID: <20030809115845.18739.00001067@mb-m18.aol.com>
Source record: 27734

<< I'd like to be able to run the line
out audio from a scanner into the sound card and be able to display
the audio envelope. The amplitude scale wouldn't need to be calibrated
as long as I could count the number of divisions, I could compare the
peak deviation from the 252 to other signals on the air. A quick and
dirty deviation comparison checker. >>

Mike-

I have an old Heath deviation meter that uses a peak-reading meter to display deviation. It was necessary to calibrate it using the "Bessell null method" using a signal generator with sine-wave FM modulation. The signal is received on an SSB receiver with a fairly sharp filter. Modulation is adjusted for a carrier null, and the deviation is obtained from a table of bessell functions, based on the ratio of modulating frequency to peak deviation. This method is outlined in some ARRL publications that cover VHF-FM techniques.

What you describe is very close to how other deviation meters work. They receive a signal, convert it to an intermediate frequency, FM detect and display the detector output on an oscilloscope. It is a lot easier to calibrate this kind of meter, since you only have to offset the transmitter's frequency by plus and minus one KHz increments, and adjust the oscilloscope to display the correct offset.

Using a deviation meter, it is normal to use some loud sound such as whistling directly across the microphone, to adjust a radio's peak deviation control for about 5 KHz. Then you adjust the radio's microphone amplifier so average speech runs around 3 KHz.

<< I have a Turner desk mic connected to the 252 at the moment. I don't
really know if It's an improvement or not. I built a little adapter
box with 6 push button switches so I can control the radio, >>

The problem with the HTX-252, is there is no microphone amplifier adjustment, and some people think it should work when speaking some distance away from the microphone. Your Turner microphone may provide the extra amplification needed to talk at a greater distance. While I won't tell someone they shouldn't do that, I can at least partly justify keeping the adjustment set for talking very close to the microphone. By close, I mean about a quarter inch or one centimeter.

At home in the shack, you probably don't have sound proofed walls and ceiling, but the ambient noise often consists of only an air conditioner blower or Television sound from the next room. Under that condition, it wouldn't hurt to have a little more gain so you keep the microphone at a comfortable distance. However, many uses of the HTX-252 involve mobile operation where there are a

lot of loud noises from the engine, traffic and an even louder air conditioner blower. In a heavy rainstorm you may not realize how loud it becomes. The result is a decreased audio signal-to-noise ratio. The only way to overcome that is by close talking, which increases the signal level with respect to the background noise level. This condition is the basis of most Ham Radio and commercial communications equipment designs.

Obviously many people don't subscribe to that philosophy, so there are a number of amplified microphones on the market!

I had a KDK two meter FM rig that drove all of us nuts with a similar problem. It turned out that it was just off frequency from the factory. No one thought to check its frequency until lots of other things had been tried. Talk about red faces.

2163. Looking for help with an HP 8554B spectrum analyzer plugin

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-09 16:12:35 UTC
From: "Eric F. Richards" <efricha@dim.com>
Message-ID: <i6s9jvg0nk7io3gi7l0qj3lc6m7cldm3i3@4ax.com>
Source record: 27736
Cross-posted to: rec.radio.shortwave,sci.electronics.equipment,rec.radio.amateur.equipment

Greetings...

I don't know where to ask this, so I'm shooting for multiple groups.

I purchased an HP 140T mainframe plus spectrum analyzer plugins, including the 8554B mentioned in the subject, at a hamfest. It turns out that it is working but is quite "deaf." From asking around I have been told that this is a common problem for this plugin and the culprit is the first mixer.

Well... the first mixer is an upconverter to 3 GHz, and one of those magical microwave "cans" that make no sense to those of us used to thinking in lower frequencies. The only semiconductors in the can are a pair of diodes, back to back, with the designation "385" on them. HP weenies have suggested that it could be short for 1901-0385, but that part number turns up very few references, and none with the nature of the diodes and their operating characteristics.

So I'm wondering if anyone out there knows what type of diodes these are likely to be and what kind of characteristics I should be looking for in replacement parts.

Does anyone know anything about this dinosaur? Any help would be appreciated.

Oh, BTW, the rest of the analyzer and frame work fine. I'm using a borrowed 8553B plugin with it now and getting the results I'd hoped for. While I don't plan on doing any critical work with it, the 8554B is a more capable plugin and I do have to return the borrowed one...

Thanks much!

You might be able to substitute them with 1N5711s. It looks like somebody
must have accidently transmitted into this unit.
You can find these plug-ins at hamfests in the 50 to 100 dollar range now,
but the 5711s might at least get you started.

Pete

>

These *might* be microwave mixer diodes, like the 1N416D, for example. The thing to look for is noise figure. I have a 1L20 spectrum analyzer plug-in for my Tek scope, from the same era as your SA (but much much cruder). I have never seen your SA, but all I can say is that the first mixer in my 1L20 contains a single diode.
Do yours look like this?
http://www.dfpresource.org/1n416d.jpg
If so, you might try a kludge like this:
http://www.dfpresource.org/modded1n5711.jpg
Worked for me.

No the radio as an IC-V8 is NOT type accepted.
The same basic radio is known as an S4GS in its commercial version.

> is for the amateur operator's personal use at his licensed amateur radio
> station and the requirements of Sec. Sec. 97.315 and 97.317 of this
> chapter are met.

The problem is not section (c) it is section (b) which says:

(b) After April 27, 1978, no person shall manufacture, sell or
lease, offer for sale or lease (including advertising for sale or
lease), or import, ship, or distribute for the purpose of selling or
leasing or offering for sale or lease, any external radio frequency
power amplifier or amplifier kit capable of operation on any frequency
or frequencies between 24 and 35 MHz.

Note: For purposes of this part, the amplifier will be deemed
incapable of operation between 24 and 35 MHz if:
(1) The amplifier has no more than 6 decibels of gain between 24 and
26 MHz and between 28 and 35 MHz. (This gain is determined by the ratio
of the input RF driving signal (mean power measurement) to the mean RF
output power of the amplifier.); and
(2) The amplifier exhibits no amplification (0 decibels of gain)
between 26 and 28 MHz.

The Palomar amplifier is designed for CB operation, and falls squarely in this
frequency range.

Section (d) gives a limited out, but only for non-kit amplifiers built by a ham
and sold to a ham:

(d) The proscription in paragraph (b) of this section shall not
apply to the marketing, as defined in paragraph (b) of this section, by
a licensed amateur radio operator to another licensed amateur radio
operator of an external radio frequency power amplifier fabricated in
not more than one unit of the same model in a calendar year by that
operator provided the amplifier is for the amateur operator's personal
use at his licensed amateur radio station and the requirements of

Secs. 97.315 and 97.317 of this chapter are met.

This amplifier cannot be legally sold in the US.

Thus all amplifiers using, e.g., tetrodes can no longer be sold?

> The Palomar amplifier is designed for CB operation, and falls squarely in
this
> frequency range.

I guess that's why the manual specifies 40 / 20 / 15 / 10 meter operation.

No, I'm not being obnoxious, just curious how one ham can sell
another ham ANY amplifier under those rules.For example a 30S-1
with a 4CX1500B would be illegal to sell? I just ordered an amplifier
with a pair of 4CX800s in it. It will work on 10/12/15 meters. Has
substantial gain (about 50W in for 1500 out). Will I be stuck with
that amplifier forever, or will I be able to someday sell it to another ham?

Interesting Drake Collectible for Sale

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$125 plus shipping
This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.
This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm

Its been pointed out to me that I have been an unhelpful old grump -
and, re-readinfg the Amateurs Code, I can see its true. My aplogies
all round - should have engaged brain before opening mouth.

Its an interesting fault - have downloaded the MFJ manual and will
study it when I have some spare time. However, a few comments in the
meantime...

1. If there was a faulty batch of tubes, they would have been cleared
out by now - MFJ would have had words with Amperex, so they can be
eliminated as future fault causes.

2. is it a design error - possibly, but then again MFJ would be aware
of it by now and offered a correction - this company would not stay in
business in the Amateur Radio marketplace if it didnt.

3. The filaments high at 5.7 volts - it can be safely assumed that MFJ
would have set them up properly at the factory - this suggests that

the AC line voltage is high - variations are not unknown (here its plus/minus 10% on 240VAC - fine, except when it causes marginally rated 220V European equipment to die - took me a while to figure that one out....). Check the AC line voltage with a KNOWN ACCURATE voltmeter (I like Fluke, because they come out of the factory set up properly) and adjust transformer taps if necessary.

4. is it a parasitic oscillation - the traditional check is to swing the plate tune capacitor acrtoss its range and check for multiple small dips - if so, there is one. A more scientific way is to use a spectrum analyser if available, a cheap way out there is to sit a scanner near it and tune across every band etc and look for birdies etc.

5. the dynamic bias (good way for QSK switching) and ALC circuit in this thing looks interesting - possibly a fault there (which would explain why the AL80A doesnt have problems - its fixed bias) - but this is speculation, as I said I havent had time to check/compare both circuits or analyse how the AL80B circuit is suppossed to work.

Anyway, again my aplogies to the group for being a Grump - will try not to do it again.

73 de VK3BFA Andrew

Perhaps you're on to something. My AL80A was mfg by Prime Instruments
which made a fine amplifier, still with the original Eimac tube.

Sweet. Looks like a single balanced mixer with the LO injected in the coil on top? I'm way out of my league here, I'm hoping that someone in the know jumps in here, I'd like to know myself.
But, I'm guessing you tested those diodes by lifting one lead and determined that they indeed are dead, if so, I'd try 1N5711s in there. Schottky barrier diodes like this are used in mixers all the time because of their speed (no charge storage), but from what I understand, weren't used back then because, well, they didn't exist. 5711s are dirt cheap and the test shouldn't take long, my 1L20 setup took me about 2 hours, mostly spent machining the pin doohickeys to get the diode to fit in its socket.

I can only answer you indirectly. In the 70s, the Palomar company sold 4-watts-in, many watts out amps to the CB crowd. Caused the FCC to totally rewrite the rules on amps around 1978. Since then, an HF amp requires at least 50 watts in, to be legal for mass sales/manufacturing.

Whether Palomar took the trouble to make your amp "clean" for the bands you want to use, I can't say.

There are a couple of qrp amps around, if you can find them. One is a Ten-Tec amp sold in the early 70s, about 5 watts in, 50 watts out -- you might find it on Ebay. Also, Tokyo hi-power (I believe that's the name), currently makes a qrp amp that some hams bring into the country. You could do a search on that.

Do what you want, but I'd sell the Palomar rig to a CBer.

Unfortunately I already did that, and Agilent's Big Book of
Semiconductors doesn't have a listing for it.

Don't take this wrong, but Usenet is kinda my last option. Or second

Yes, surface barrier transistors and such used the Schottky effect in those times, but as a collector of some 60s vintage stuff, Schottky diodes are absent in these units. Every other kind of diode, Schockley, tunnel, snap, varactor, back, GaAs, Ge, etc... but not a single Schottky diode. In my 1L20 the 1N5711 performs the same as the 1N416D. So why did they use a complicated to build unit like the 416D if they had had 1N5711-style devices back then? I suppose they must have been used in the 60s because analog samplers with Schottky diodes are certainly in the literature, so maybe they were too new, expensive?
Really, I'd like to know.

> The principle was postulated in 1938.

But as a commercial product, when did Schottky diodes arrive on the market?

Testing a microwave mixer diode using an ohmmeter will guarantee that
it's dead. They make special low-current meters for testing these
animals.

Ahhh, but that's the core issue. I can't even find specs on the
thing. I've been told that finding a contemporary replacement should
be no problem, but without specs, I'm really in the dark here.

Pete,

I'm probably going to have to go this way since other suggestions have
appeared to be dead ends for now. Thanks for the suggestion. So...
is a '5711 a high-speed Schottkey? (I know, I can look it up, but my
connection is very slow right now...)

Thanks,

Eric

True, I use a 1.5V cheapie analog meter for testing tunnel diodes, but in my limited experience, diodes like the 1N416D can be tested with modern DMM with no damage. But you're right, I should have recommend testing with low current anyways.

> have a QSO beneath them.

I get totally pissed off when I'm talking to other amateurs, usually a
few hundred miles away, usually about 15 of them in the group, with my
rf gain rolled back to eliminate those nasty atmospheric noises,
making efficient use of the 3 kc's we are all sharing, and a bunch of
mindless jerks try to have another QSO on the same frequency. The
frequency is in use. Go find your own.
BTW, the amount of power I run is irrelevant. But just in case you are
interested, my henry amp has not been on in 3 years. I've got it
partly dismantled. I've only been running 100w for a good while. But
even if I ran 1500w output "I can only do 1300-1400w actually", I
consider people that purposely ignore existing QSO's, mindless idiots.
I also consider them illegal, being they are guilty of malicious
interference if they knowingly do this. "In the USA anyway" You want
to know what happens if we all try to run lower power? We are totally
ignored and run over like 3 legged dogs crossing an interstate. We
HAVE to run high power if we want to keep our freq clear of
interlopers that have no concern for others that are already using the
freq. If we don't , we are run over.
You can say I'm full of it, but I can test this theory over and over
again, and I'll tape a nights worth of it for you, and prove it to
you. The AM guys on the west coast are some of the worst offenders.
They don't care who might be using the freq first. Being they are
running AM, they feel they are !***Special***! , and get to flaunt all
rules and regs. MK

The vast majority of 3-500z amps have the filiment voltage set too
high from the factory. Probably 80% of them. Maybe more... most
henrys, including my 2k classic, TL-922's, SB-220's, most Ameritrons,
etc, all are guilty. You can stretch the tube life out a good bit if
you lower the voltage. MK

I'm taking my Technician-class exam soon, and am going to be needing a radio.
I have very little money available to invest in this, so I was wondering if somebody had one they didn't need and could sell for cheap.
A simple 2-meter transceiver will work fine for me; I've heard it's a popular band. However, a multiband one would be nice...
I've only got about $50 max to spend here, maybe a tiny bit more. I'd be willing to build or scrounge up some pieces, e.g. speaker box, microphone, antenna, cables, etc. so if it's missing a few accessories, that's OK.
Can someone help me out?

Thanks!

I have a nice older radio in good condition that I could sell you for $50 plus shipping. Shipping to San Jose shouldn't be much at all. E-mail me, the mail's good.

> frequency is in use. Go find your own.

Wow, I wonder if we are talking about the same thing here - what I was refering to was the bunch of lids starting their scheduled net (which the rest of the world should know about anyway, after all its "Their " frequency) all running high power with the rf gain wound right back and not even noticing that they are QRM ing people underneath them -and these same lids then get really pissed off when someone with more power does it to them. You arent one of these people are you? - the ones I was speciffically reffering to were about 2 years ago (the most noticeable) when I was operating portable on 80m in the middle of a forrest in the middle of winter (bloody freezing cold and wet, operating QRP) during a safety net for a car rally and two Americans came up and started their QSO - no way they could hear anyone under them, and I dont think it would have made any difference to them anyway. We couldnt QSY as the QRO guys didnt leave breaks, just kept on yakking for hours and hours and hours..... dont ya just love em....

But hey, this is the way it is - in psychology its called the "law of comparative advantage" - If I have a big SUV then those nasty little foreign cars wont bother me when I hit them - but eventually these drivers get a big SUV as well so eventually everyone is stuck in traffic driving gas guzzling trucks going nowhere. Same applies to QRO - if nobody used it, then maybe, just maybe, no one would need it.

BTW - whats the radiated power adjacent channel from a amplifier putting out 1300 watts - assuming its well designed and has -35

supprseeion (sorry, cant think of the right word here...or the right spelling....)

> BTW, the amount of power I run is irrelevant. But just in case you are

Of course you can prove this theory over and over - the rest of the world knows that - we hear them every night..... all over the bands - ever wondered how it got this way.....

Good tips...all of these. By the way, this is the worst schematic I have
ever seen on any piece of electronic equipment.
I take it that the 80A was built by another company which was bought by MFJ.
I'm beginning to think we should convert this amp to an 80A even if the
active bias ckt is not the culprit here.

Thanks,

Chuck, KE9UW

As I understand, Ameritron first came out with the AL-80 which wasnt too
good, then Prime Instruments bought out Ameritron and upgraded and
improved the AL-80 into the AL-80A. After that it gets cloudy. I think
MFJ bought the ham stuff from Prime and came out with the AL-80B. Even
though my AL-80A says Ameritron on the front the back says Prime
Instruments.

If anyone knows better please come forth.

The AL-80A is a good amp for the money, $500-$800 . Power out 800 to
1000. I don't like to push mine too much so I keep it down around 800
in SSB. Also I usually don't use a amp, 100-200 watts gets the job done
most of the time.

Source record: 27590

For what it is worth there is a mod for AL-80B's to get rid of the "dynamic bias circuit used to cut off the idle
current and reduce heat"

There was an apparent problem with the dynamic bias circuit introducing SSB distortion. See URL:

http://ham.shineline.it/i3fue/mods-a-d/al80b.txt
Proceed at your own risk. Caveat Modifcatious !!
Remember most mods posted on the web are conjured up by Amateurs !!!

I bought my AL-80B used and it has this mod -- left it alone -- been pouring out the Watts w/o a problem for 2 years now.

AL-80's were (still are ?) an Ameritron Design as far as I know. Affiliated with MFJ somewhere along the line.

RECEIVERS, Mil & Ham, FS

WS NO 128, Special Forces set, receiver unit, 2 to 8 MHz, rx tunable. Good condx, with circuits, info etc. £80 or exchange ? something in a similar line maybe.

German WWII E10K receiver, good condx, with valves £160

Transmitter SR, 5 channel VHF set, in very good condx, rare item..... £30

Racal PRM-4031 HF transceiver offered for exchange. (see Page 4 for picture) 10W hf multimode. set and battery only, no mic, ae but with connection details etc. for exchange.. Interested in something similar.

Hallicrafters S-38 receiver. paint was poor so has been stripped ready for repaint, set working, otherwise good condx, £30.

Eddystone 840C rx , good condx, working, £80

Kenwood R600 HF 0-30 Mhz Communications receiver, fully working, smll scratch on top of case otherwise fine. £150
will exchange for military set ?

Heathkit RG-1 General Coverage receiver, 0.6 to 32 MHz, xtal calibrartor, am/cw/ssb, slo mo tuning, nice condx and working. £50

Pye Europa UHF trcvr FS 3 channel, fitted RU246 & 433.450, 5W o/p, good condx £15

MARINE SETS:

Sailor RT-142 VHF Marine radio telephone, ideal for conversion to 2 Mtrs £35

Eric,

I can confirm that this is/was the right part number. In the '70's a matched pair was ~UKP 150.

You might try something like a pair of BAR28, if you can get them, (Shottky barrier - useful to 10GHz) at UKP 0.5 each IMO they would be worth trying.

Good luck,

If you put it in your carry-on luggage and pass it throught the x-ray you should be OK ... I would have a copy of my license and allow a little extra time at the security check point in case they want you to take it out of the bag, turn it on and show them some evidence that it works as they would expect ...

I travel with a backpack station (FT-817, auto-tuner, various chargers, balun, coils of coax and wire, etc. quite frequently ... I often am asked to allow a visual inspection after the x-ray, but after that it's not a big deal. Just takes a few minutes, even with all that stuff ... an HT should not be a big deal.

As far as the tape goes, if the battery pack runs the radio as expected, doesn't look suspicious on x-ray, and you explain, I think that will be OK. (YMMV ...)

> PS I am not checking in luggage - just carry on.

I had a similar problem with a "fire" pager "prior" to 9/11 - and I wasn't even flying, just going to the gate. I believe the trick was, to get it to make noise, show them what it is used for. Tell them it is in there, explain it to them... The x- rays should pick out the batteries, show they can be removed. Maybe tell them that it is similar to the radios they are holding. Show proof of your license if need be. BUT don't be expected to be allowed to use it on board. Last I recall, that was a huge NO..... C.L.

Swantenna - Remote Control Mobile Antenna......$175 plus shipping
This is the Swantenna from the late 1960's. If you used Swan equipment mobile in the 1960's, you will remember this one! Long before the screwdriver antenna, this antenna allowed you to change bands from within the car. I had this one on my first car back in the late 1960's, a 1963 Oldsmobile and it was really slick. Used it with a Swan 270 Cygnet. This has been stored for over 30 years in my dad's garage and was found recently in the original box. Operating condition is unknown and the black plastic top of the coil is cracked. Includes the antenna, the whip and the control head and I have a very rusty Swantenna which I will include for spare parts. This has a good coil top. I do not have the connecting cable that connects the control head to the antenna.

I was wondering if anyone knew of any 2m mobile radios that have a remote head.
It seems the only remote head radios are dualband, HF+, etc..

I haven't seen them blow out from signal generators, but I have from some of the high output synthesizers that would put out +23dBm. It's too bad that they couldn't make a more robust mixer.....you would figure that they would be using at least a Level 17 mixer.

If you were using the freq first, then yes, they were lids. But also,
you did most likely have a puny signal if you ran QRP on 80m. They
might not have heard you with the rf gain full up. Did they actually
say they had the gain rolled back?

Probably so. I don't need it. I have good antennas. But you are going
to have to expect things like that when running a peanut whistle on
75m. I wouldn't lose much sleep over it.

2239. Weather bulletin (SYSOP, METAR, SPECI, TAF)

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-12 11:07:06 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3f38ca50$1_2@news.vo.lu>
Source record: 27612

Hi,

As ex-meteorologist I know that weather bulletin from the air force (sysop, metar, speci, taf, pirep, etc) are accessible on the Internet, usually not for free.
There is also the possibility to capture directly these messages on the air using a short-wave receiver.

As licensed ham I am using a TS-570D, CW decoder (easygram, hamscope...), and I bought the Super Frequency List 2003 CDROM ftom Klinbgenfuss.
But even using these tools I cannot find on the HF spectrum from 0-30 MHz the frequencies used by these stations to send these bulletins.

Can someone out there give me some frequencies (and optionnaly the mode) I could use to read such bulletins ?

Thanks in advance

My 8554B says "Maximum 10 dBm" on the front in big red letters.

There's probably a reason why they put that on the panel.

I didn't realize that 'pretty' was such an important factor in selecting
communications equipment. Maybe someone should publish some parameters
for those of us who are 'fashion challenged' so that we can learn to
include it along with sensitivity, selectivity, shape factor etc.

2247. Which ATU?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-12 15:16:13 UTC
From: Savage <look@this.con>
Message-ID: <1060701276.47327.0@damia.uk.clara.net>
Source record: 27620

I think I've narrowed it down to either the MFJ-969 1.8 to 54MHz roller coaster, or the MFJ-934 combined ATU and artificial earth, but I would appreciate some input from past/present users.

My present rig is a Yaesu FT817, which so far has been used only for RX on HF and Tx on V/Uhf, but I am looking around for a 'base' rig of up to 100W max out for the future, so the ATU would need to cover all power and antenna feed contingencies. I am prepared to look at other models of manual/metered ATU but I really like the looks and specs of the 969 with one reservation. The FT817 is QRP and I haven't seen a min RF power spec for the MFJ 969

I don't have any HF long antennas in use yet, save for a simple end fed long wire for Rx but on the plus side, I already have a 10M dipole and vertical ready to go up on the house, so when I start looking seriously for a multi band antenna I could survive happily with something which will tune between 15 and 80M

Earthing/grounding is a problem. The only place I can drive an earth stake is around 18 feet down and 6 feet out to clear the foundations, and means digging up a couple of paving slabs on a path to cover the wire and drilling through a concrete 'car port' slab, but I can probably use the domestic water or CH pipes for the FT817 for the time being unless the AE on the MFJ-934 does what it's supposed to do.

2248. Icom IC-T81 - No operation on Battery?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-12 16:41:41 UTC
From: tdoda21@lose.this.rogers.com
Message-ID: <nurR1rKS7zEK-pn2-ICoErbU9qbtq@lazer>
Source record: 27621

Greetings:

I have an Icom IC-T81 which stopped working when only on battery.
It still works fine off of the DC cable. I have the unit apart, and
there
is no connection from the negitive battery lead to the chassis of
the radio. There is what seems to be a fusible link from the negitive
terminal to the chassis, but don't have a schematic to verify, and
NONE
of the parts have PCB locator numbers (R102, IC102, etc).

The DC power block is not loose, and all the pins are making
connection to their associated traces.

Anyone know what this part is, and it's rating?

Thanks,

Tedd Doda VE3TJD

Price?? You've got to be kidding. They don't even have a model number available to
advertise
yet. But 200 watts sounds like fun though. You purchase the rig and pay through the nose,
spend hours drilling, running cables, shielding everything, and when you go for your first
test
of the transmitter, BANG! POW! You've just deployed all the airbags in your vehicle. Yep.
Sounds like fun it me. (I'm sure they'll have a disclaimer somewhere, in teeny, tiny print,

on
the inside case, in a foreign language). ;-)

I am in need of a manual for the Kenwood RZ-1 Wide Band receiver. I need both the owner's manual and the service manual. Copies would be OK and I would pay for cost of reproduction.

Thanks,

Jim KC9ID

Only way to run QRP on 80m is in the dead of winter at 2-3am in the morning.
Most of the time QRP on 80 means 400 watts output.

I think it must go back to what devices were available at that time; my
8558B specifies no more than +30dBm.

Hi Tedd

I have a T8A with the same exact problem. I emailed Icom and they
told me it was probably an open coil. After opening the radio and
checking the coil I did discover that was in fact wide open.

I'm not sure if the T81 and the T8 are the same in that respect.
If you want email me and I can tell you the Part number. Its a good
thing Icom makes a usually reliable radio because their customer
service sucks. I ordered the parts over a month ago now still
nothing!! I wish I knew the value I'd try to find a nother source.

Let me know how you make out.

I have been struggling for some time to get RF out of the TX audio on
a TS-440SAT when in data mode. I have ferrite blocks everywhere;
power lead, 13 pin audio lead, aerial feeder, data control cable.
Sometimes I seem to cure it then it returns. Checked every grounding
screw in the rig, checked all internal connectors. Fitted isolation
transformers on audio. It stillcomes back. Does anyone know where
the weakness is in this rig?

I had this problem myself, years ago. Turns out, the RF was getting in through the Mic cable. If you still have the mic connected, even though you are putting your data in through the back, try disconnecting the Mic, or using ferrite on the mic cord right at the front panel connector. Good luck.

Are you sure it's only in data mode? And are you sure it's RF getting
in? I'm asking because data is more sensitive to frequency variations
than most other modes.

There is a known problem with the VCO in this radio. Contamination of
a conformal coating designed to protect the components from humidity
is actually hygroscopic. The fix is to remove the coating and replace
it with hot-melt glue.

Any Kenwood warranty station will perform this mod under warranty on
any TS-440, regardless of whether you were the original purchaser (or
they used to... I can't speak for Kenwood).

Interesting. I've encountered and heard of numerous strange RFI problems
in mobiles; but never heard of airbags being triggered. Anyone have
anything to base this on? Can't help wondering why they don't go off
when vehicles pass through the high ERP beam from SWBC sites - one I can
think off offhand is the RCI site with a main highway passing alongside.
Not sure what the effective ERP is in the centre of the beam, but it
must be more than most Hams could create, even at 3 feet?

The RF is definitely getting into the data audio as the mic is not
plugged in and the mute line is grounded.
The effect is that the transmitter runs full power rf out regardless
of gain setting. When it is stable the power controls smoothly with
the tx (mic) gain control.
Richard

Nope. I've been running 100 watts for quite a while and never had a
problem with airbags electronic ignition or anything else. I wouldent
think another 100 watts would make that much difference, but then who

knows?

I used to run a TS-667V in a Jeep Wrangler TJ. I had to reset
the computer a few times by removing all the juice. I've also
had to do that with a semi-dead battery. Now I have a battery
switch on it, just turn it off for 30 seconds. The vehicle had
no problems with a TS-250. 55 watts on 2 meters does nothing.

The only problem I ever had, was running >100W VHF FM, would cause the rear window wiper in my Explorer to cycle.

This is what industrial designers do for a living.

Can you work the knobs easily, can you read the settings, are the keys too
small... etc..
It dosen't have to be ugly, and most "engineer" driven designs are.
I speak from experience, as an engineer who knows what's good looking, but
can't make it look good to save my life. :)

My current project www.mobilecommand.net had many hours of input from
industrial designers and expert plastics toolmakers. Source Design Group Ltd
did a fantastic job, IMNSHO.
http://www.sourcedesigngroup.com/

There are books to help the challenged engineer. "Turn Signals are the
facial expressions of automobiles"
http://www.jnd.org/TurnSignals/TS-TOC.html is a very good one, and of
course a copy of "The measure of Man and Woman"
http://www.wileyeurope.com/WileyCDA/WileyTitle/productCd-0471099554.html

Hi Tom:

On Wed, 13 Aug 2003 12:35:41, Tom S <t_stenbraaten@hotmail.com> wrote:

:> I have a T8A with the same exact problem. I emailed Icom and they
:> told me it was probably an open coil. After opening the radio and
:> checking the coil I did discover that was in fact wide open.

I've uploaded a picture of the unknown part. Go to:

http://www.sentex.ca/tedds_place/t81-power.jpg

Near the bottom of the picture, there are 3 silver domes. This
is where the power connectors for the battery contacts get soldered
to the board. The left most one is the negative terminal. The little
white arrow below this terminal just happens to point to the part
in question.

:> I'm not sure if the T81 and the T8 are the same in that respect.
:> If you want email me and I can tell you the Part number. Its a good
:> thing Icom makes a usually reliable radio because their customer
:> service sucks. I ordered the parts over a month ago now still
:> nothing!! I wish I knew the value I'd try to find a nother source.

I've been down that road before Tom. It's hard to believe, but since
Kenwood has gone to a national distributor for parts (Global
Electronics),
the parts availability has been the best of the "big 3". I've always
had a problem
with both Yaesu and Icom.

Let me know if your radio is simular.

One of the items I consider important in a mobile rig is can I operate
it while not looking at it. In other words I'm keeping my eyes looking
out the windshield not on the radio. I use a FT-900 and it is not the
most user frendly radio for mobile use however I have everything set up
so I don't have to twittle with it much. The new Kenwood looks to me
that it may be better. With large backlite buttons and 200 watts it
should make for quite a good mobile. I'll be waiting for it's arrival
and price, then maybe....., but I do like my FT-900.

I'll say this about looks. When I first seen the ad for the Kenwood
TS2000, I thought that has got to be the uglist radio I have ever seen.
In person it looks quite good, in fact I own one and I find it to be the
all in one radio. If I had only one choice of radios and wanted to do

everything in ham radio, sat., hf, vhf, uhf, moonbounce, ect, ect the TS2000 can do it 160 meters to 1.2Ghz, AM,FM, SSB, packet, rtty sat, ect ect, you name it it will do it.

I have a question re: software for the PCR-1000. I'd like to know whether the software features a schedule timer. Such as, at a certain time switch to this freq and mode, then at another time, switch to different freq and mode. If so, can it run constantly? Or does it need to be reset, or rescheduled every day? Could I run it for 2 weeks unattended, for example?

Thanks for any help!

Seems to me that Ten-Tec is the leader. They "came out" with the Orion only to have and 18 month delay before you could actually buy (not just order) one. Then Kenwood followed suit and announced their new radio, only it will be available at who knows when in the future. Then came Icom with their new introduction at Hamvention this year. Depending on which rep you talked with, it was priced at $5,000-$10,000. But it isn't "out just yet". Guess all we have to do now is wait for Yaesu to introduce their latest HF rig this isn't available yet. But Ten-Tec did lead the recent trend in introducing radios you couldn't buy.

One of the folks I used to link with using CLOVER on 20M
had this exact problem. Turned out to be an non-connected
ground on the coax connector. Coax had been twisted and
the braid had come loose from the shell of the PL-259 and
was no longer making any contact.

TS-850 instead of 440 but those two rigs are very similar.

I recall some issues with the different ground pins on the
13 pin connector as well. Again with the 850 but 440 is similar.

For Sale: RCA Type LM-1 Multimeter with Manual and Spare parts
Meter.....$90 plus shipping

This is an unusual looking Bakelite cased VOM which is from the late 1940's and early 1950's. Measures volts from 3 to 1000 ac and dc volts, 1 mA to 1000 mA DC and resistance. This unit is in excellent condition and includes a copy of the manual. Also included is a 2nd non-working unit. The non-working unit has a free movement. I did open up the inside and it is clean with no evidence or of abuse or arcing. It is missing the battery cover which is just a flat piece of plastic.

I just disconnected every multi-pin connector in the rig that carries audio or rf and wiped the pins and applied some 'switch cleaner' lubricant. I also removed several screws around chassis components and antenna connector and cleaned the mating surfaces with a glass fibre brush, wiped with same lubricant and refitted screws. The rig is stable again. Seems that the TS-440 must have some horrendous rf curents circulating around the chassis that can't tolerate a few milliohms of contact resistance. Now we'll see how long it stays stable!

Oh for a solid cast aluminium chassis.

I bought an Inrad #528 cw filter off ebay for a Kenwood R-2000. I removed the bottom panel per the manual.
The space provided for the YG-455-C Kenwood filter is not large enough for the Inrad. I suppose I can glue it up above the mother board.
The real puzzler is, the Kenwood manual said to solder the YG filter in place. I see nothing to solder anything to!
The Inrad has 5 pin sockets on each end. Has anyone ever installed one of these in one of those?
I contacted Inrad for help, but no answers as of yet.. Thanks. James W5LWU

Recently passed general class after having let my old advanced class license (KA1UL) lapse quite a few years aso. I have a couple of partially restored boatanchors in the basement but am looking into getting a more modern HF transciever...probably used, only a few years old. So many manufacturers and moidels on the market these days...

What rigs would you guys look for with this list of features.

1. CW and SSB only...don't need AM, FM or FSK

2. RF output of 80 to 125 watts PEP max.

3. 12.6 V DC operation rather than 117v ac.

4. 80 to 15 meter bands minimum, 160 and WARC bands desirable.

5. RCVR section general coveage highly desirable.

6. some bells and whistles are nice but good overall RF performance more important.

7. Simple operation and reputation for reliability.

I have an 80 meter off center fed dipole with tuner up and working...What should I feed it with while finishing the restorations on the Ranger and KWM2?

You forgot how much money do you want to spend ? With the Icom 706 selling
new for under $ 800 you can get a lot of rig for that price.

Heh heh! I much prefer my 850.

That 13 pin connector is wired the same though ...

Source record: 27467

I looked at the specifications for an old pair of Maxon GMRS 210+3 radios, and thats exactly what I want. Its programmable, has two sets of commonly used frequencies and is pretty powerfull. Does anyone out there make something like the 210+3? From Maxon or anybody else. Thanks!

Motorola makes FRS/GMRS radios:

http://commerce.motorola.com/cgi-bin/ncommerce3/CategoryDisplay?cgrfnbr=9
&cgmenbr=126

They have both FRS and GMRS channels. They also make them with one or the
other. They're a bit pricier than others but are probably better radios.

I did a Google search for "GMRS radios" and got over 45,000 hits.

I agree with the 706, does your hf+ 2m and 70cm--all modes.
Down the road when the boatanchors are up and running you
can stick the 706 in the mobile.

Congrats on the re-licensing. Well done!

Re rigs: You probably won't find any CW/SSB-only unless you go way
back to the hybrid rigs like the Kenwood TS-520.

I like the Kenwood TS-940S. Nice rig, built-in antenna tuner. Modern
enough to support split operation and RIT. General-coverage receive
with good sensitivity. Good reliable rig with a few bells / whistles.

Hello All,

I've tried to make a selection of the best info!

Look at my website:

http://www.qsl.net/pd0rkc

New amateur SOFTWARE.
COAX cable info (table).
Compare many ANTENNAS
(tonna/m2/diamond/flexa/cushcraft/cue-dee/hygain....more).
SATELLITE freq. keplerian elements, tracking software (the new NOVA, and
SATSCAPE).
KENWOOD microphone & reset info (and many more).
Datasheets electronics.
All you need is there to find!!!!!

If NOT let me know whats missing (my e-mail adres is on my website!).

You won't find any radios legally allowed to transmit on those frequencies with that power level. FRS is limited to 500mw and GMRS is limited to 2 watts.

With that said, there are many dualband ham transceivers that can be modified to transmit on both bands. If you search the internet you will find mods for many types of radios. Of course, we all know it's illegal to transmit on FRS and GMRS using one of these modified ham transceivers, plus there's a posibility of performance problems since the radios weren't designed to transmit on those frequencies.

Hello KB0SWS,

I've been on the newsgroup for a few years.
I posted software & info once in a month (when I updated my page with news).
New visitors can take a look.
When I have some news (like the new kenwood trx) I post my url for info.

That's called news on the newsgroup!

What do you do for the newsgroups!

One mail at one newsgroup (is that spam?).
Some people see new adresses of other newsgroups! (hey is that an idea for people whoe does not know?).

I see often people complain at other people who trie to do the best with their info.
Some people use that to get atention from other complainers, they prefer to read
the comments on that, what a waist of time, use your energy for hamradio news.

Maybe it's better to put your comments on a new newsgroup (news: alt.complain?????).

I never said anything was wrong with the posts. I was only commenting that
you advertise your site often. However, if you think that everyone here
responding to your site, is putting it down, then maybe it needs to fit into
the groups a bit more.

> people whoe does not know?).

The 'Rules of the Road' for Usenet hold that a post is not spam if
it has a BI (Breidbart Index) of less than 20. The BI is calculated by
taking the square root of the total number of groups an article is
posted to.

Full details on this measure may be found here.

http://www.stopspam.org/usenet/mmf/breidbart.html

From what I can see, Cor posted an identical message to six
groups. The square root of six is about 2.45, so his message cannot be
considered spam under Usenet guidelines.

Said guidelines are here.

http://www.faqs.org/faqs/usenet/posting-rules/part1/

If his posts bother you, well... most Usenet newsreaders do have a
filter or 'killfile' function. ;-)

Pity you didn't read the whole article and spot the 45 day window Doc

Our friend has a current "probable" BI of 12.63 over a 9 day window at the
DSRS net abuse lookup archive. I have *not* checked for any nym shifts and
this present post has not yet reached the archive

I can single post it on all those newsgroups (what's the difference?).
Okay response comes also in all newsgroups, those few mails (also in the past) makes some people mad!?!?!?

I like to see when people comes also with urls of sites who have new software, or some intresting info!

News for the newsgroups!

Most of the spam is commercial adverticeing, I do NOT get payed for my website (I do not have to get payed).
It was many work, Im glad I helped some people on information.

http://sec.noaa.gov/pmap/gif/pmapN.gif
I found (on inet) this nice aurora map (each day a NEW....group fresh map!!!).

GMRS radios are pretty much all the "same spec." Basic multi-channel UHF handy-talkies, power up to 5 watts, operating in the GMRS frequency range. My point was that if you do a Google search on what you want, you'll find more information than you can weed through. (It's more than I want to weed through for you.).

But here's a freebie: I recommend you look at the Maxon GMRS-50 at:

http://www.maxon.co.th/products/data/GMRSspecsheet.pdf

Ed WB6SAT

PS: Don't forget, FCC licensing is required for any GMRS operation.

7. not six. look at the original post.

>The 'Rules of the Road' hold that a post is not spam if
>it has a BI

the 'rules of the NG' may not be measured by a dumb index,
but are highly subjective and related to the NG charta.

You are correct. The information that I read was old. It used to be limited to
2 watts, apparently. 50 watts is the legal limit for GMRS.

No, it is NOT a "CB". It is an "export" 10 Meter radio designed to be
"modded" with illegal frequencies placed thereto.
It is an A M A T E U R radio 'dude', thinly disguised to be made into a
CB and in effort to skirt the purpose and intent
of the Rules.

Because it likely doesn't meet the FCC's rules for power (too much), nor the
range of coverage, AND because it can
be used illegally to operate on bands not authorized to chicken banders, it
is not a "CB"

Bruce,

But did you look at the date of this material?

"Archive-name: usenet/spam-faq
Posting-Frequency: weekly
Last-modified: 1997/03/25"

Last-modified: 1997... It seems that this info is just over six years old, if I am reading the
article right. (Yes, I did read the article). Technologically speaking, this is ancient news,
worthy of needing to be 'updated' to today's standards.

You also need to consider *how many* different NGs a single person might subscribe to, and all
the additional messages one person might have to "filter" through. This means a BI of 2.45 is
far greater than it seems.

Personally, I (1.) like some of the stuff Cor posts, and (2.) only subscribe to the
'alt.ham-radio.vhf-uhf' NG, so I don't see so much of the same thing. I used to subscribe to
ALL of the 'alt.ham-radio.???' NGs, but it was too much repetition.

Well I guess my "Export" Galaxy "CB" with 340 channels, most
above or below the legal CB band is not a CB, but a 10 meter
radio with "illegal" CB channels in it?

Do any exist? I'm looking for the most mobile way to equip my linux
laptop with packet radio (9600 baud minimum. 56k would be sweet).

Probably a silly question, but you will still need to provide a seperate
transciever for the unit, i presume...

GMRS used to have 2 different licenses-one with a max of 5 watts, and one
with a limit of 50 watts.
AFAIK, they stopped issuing the lower power license, so ALL GMRS licenses are
for 50 watts....of course, it's difficult, if not impossible to find a UHF
hand-held radio with more than 5 watts output anyway, so unless you are using
mobile or base gear, it does not make much difference.
(of course, you COULD always strap a mobile radio and a battery pack on your
back, with a suitable antenna-it would end up looking like a military
"manpack" radio).

> With that said, there are many dualband ham transceivers that can be
> modified to transmit on both bands.

and the performance(particulary on receive) will be lousy, with a
fair amount of front-end overload issues in strong signal areas.

real legal GMRS gear is not all that more expensive(actually, if you
buy used commercial radios, they can be quite cheap).
One good bet for GMRS is the Vertex VX-10(4x)-the (1x) is VHF.
There are many used working units available, since many cities went to
trunked radio systems.
And they run fairly cheap...while Vertex has discontinued them, parts
and service are still fully obtainable(and most private radio shops
can work on them).
The software is available on the 'net, and the Yaesu ham cable for the
FT-50 will program it.
Nice, reasonablly small, very rugged.
There are many other good choices as well-if you don't mind a big
radio-the old Icom U-16 and the Midland 70-254(same radio) are
still good performers, and tend to be cheap.

> If you search the internet you will find mods for
> many types of radios.

Yep

Of course, we all know it's illegal to transmit on FRS
and GMRS using one of these modified ham transceivers,

correct as well.

> plus there's a posibility of performance problems
> since the radios weren't designed to transmit on those frequencies.

possiblity is understating things a bit...while you can
get away with it "in a pinch", the performance is almost
never close to that of a proper radio.
This can be improved substantially with custom realiginment
of the radio(may also need several parts swapped as well).
But by the time you go through the expense and the hassle,
it's not really worth it.

>GMRS used to have 2 different licenses-one with a max of 5 watts, and one
>with a limit of 50 watts.

After I posted that message, I found that you can use 50 watts on some frequencies. I know that on the frequencies that are shared with FRS, there's a 5 watt limit. On the other, exclusively GMRS frequencies, it's 50 watts. I've applied for a GMRS license as this would probably be a good way to keep in touch with my wife without having to bother with the cell phone. Now I've gotta find a decent base or mobile unit.

Stick with KWM-2 on H.f. great rig, get seperate s.w. receiver, more
flexible station that way. I use a icom 756 & 765 xcvr's but use drake r8a
as main sw receiver here. good luck. John

I have the following items for sale. Prices do not include shipping. I
will ship overseas.

National Type MCN Vernier Dial - NIB.....$50 plus shipping

Photos:
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

James Millen Wavemeter Set .....$80 plus shipping
A set of James Millen Wavemeters with the original storage case. These
are from the early 1950's. The unit
numbers and frequency ranges are as follows:

90619.....350-1000 kHz
90620.....150-350 kHz
90625.....2-6 MHz
90626.....5.5-15 MHz

The units and case are in excellent condition however a previous owner
engraved ID info on the case.

Photos:
http://members.cox.net/radiostuff9/millenwavemeters2.jpg
http://members.cox.net/radiostuff9/millenwavemeters3.jpg
http://members.cox.net/radiostuff9/millenwavemeters.jpg

James Millen Wavemeters .....$18 plus shipping
A pair of James Millen Wavemeters. One covers 3.5-6 MHz, the other
covers 18-40 MHz. The plastic cover
on one is broken as shown in the photo.

Photos:
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

James Millen Dial - Type 10008.....$18 plus shipping
A new in the box James Millen dial type 10008. This is not a Vernier.
This dial is 3.5 inches in diameter.

Photos:
http://members.cox.net/radiostuff9/millendial.jpg

Hallicrafters R-47 Speaker.....$35 plus shipping
A Hallicrafters R-47 speaker which is the matching speaker for the
SX-115 and a few other receivers. This

speaker sounds excellent. Cosmetically the speaker has a number of scratches and a chip on the upper right side. This can be seen in the photo. The speaker cord has been cut and replaced with an RCA jack. This uses one of the original holes.

Photos:
http://members.cox.net/radiostuff9/hallispkr.jpg
http://members.cox.net/radiostuff9/hallispkr2.jpg
http://members.cox.net/radiostuff9/hallispkr3.jpg

Vibroplex Original Chrome Bug Telegraph Key.....$160 plus shipping
Vibroplex Deluxe Original Chrome based Bug. The serial number is 219027 which dates it to 1961
manufactured in New York City. This bug is in very nice condition. The only known defect is that the bottom side of the dot paddle is chipped. New pieces are available from Vibroplex.

Photos:

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur

I recently purchased a used rig and along with it came a nice cigar lighter adapter that terminated in two "lugs" with screw on caps for attaching the power cable of the rig. There is no cord on this adapter itself. Anyone know where I can find a couple more of these? They seem ideal for running moderate powered mobile rigs (< 50W).

thanks!

>GMRS used to have 2 different licenses-one with a max of 5 watts, and one
>with a limit of 50 watts.
>AFAIK, they stopped issuing the lower power license, so ALL GMRS licenses are
>for 50 watts....of course, it's difficult, if not impossible to find a UHF
>hand-held radio with more than 5 watts output anyway, so unless you are using
>mobile or base gear, it does not make much difference.
>(of course, you COULD always strap a mobile radio and a battery pack on your
>back, with a suitable antenna-it would end up looking like a military
>"manpack" radio).

Used to be any handheld transceiver over 5 watts generated all kinds
of legal hoops and loops to jump, even the EPA would get involved,
Something about having over 5 watts RF radiation close to one's head.
So thats the reason you don't see handhelds with power over 5 watts,
one other reason would be battery life and cooling.

Hi,

I picked up an HTX-100 at a hamfest, no manual. RS does have the
manual available online, but for "advanced" stuff such as a schematic
and microphone connector pin out you need to buy their service manual.
Anyone have the pin out handy?

There are a couple of different ways you can go.

1. MFJ (and perhaps others) sell an electronic keyer with keyboard and you just hook it up to your radio and away you go.
2. You can buy a multimode controller with the proper cables for your computer and radio, hook it all together, load the software on your computer, and then use it to send and receive CW. Note that unless conditions are good and the signal strong, it may not decipher CW as well as you can. However, there is no problem with sending.

If if has the same plug as an HR2510, that should work, being it's
the same radio minus a few modes.

> And the pinout for the HR2510 is?

OK, OK, Hang on here, this schematic (for the HR2510) is none too clear, but here goes:

1. connector is a 5 pin "din" connector.
2. PTT switch uses both halves (but only one "throw") of a DPDT switch.
3. Both mic element leads are switched. One half of the switch connects one mic lead to pin ONE (when pressed) (mic audio out)
4. The other half of the switch is in the "ground" circuit and is the PTT lead. One pole of this switch half connects directly to pin THREE. (that'd be the PTT circuit)
5. The second pole of this last switch is circuit "ground", and connects to three different things. (a) remaining mic lead (b) one end of both the "up" and "down" switches (c) connector pin TWO <ground>
6. That leaves two more connector pins, 4 & 5. FOUR is connected to the remaining side of the "up"
switch. FIVE is connected to the remaining side of the "down" switch.

John FYI -- from a recommended book:
Mobile power. It is tempting to use the cigarette lighter plug for 12 Volts to power the mobile radio and this may work for low power units, but it is always best to run two heavy gage wires through the firewall and directly to the battery via fuses in both lines. Don't use the chassis as a ground return, ground loop problems and noise pickup may occur, run both + and - lines to the battery. FM mobile transceivers with 50 W of output power can draw up to 10-12 Amperes of current at 12 Volts. Most cigarette lighter plugs cannot handle these high currents. Operating a 50 W mobile transceiver from the cigarette lighter plug may cause permanent damage to vehicle's electrical system, and can also be a fire hazard. You can probably operate a 6 W handheld transceiver from the cigarette lighter plug, but not a higher wattage radio.

Source record: 27542

My batterypack BP-199 has become exhausted after 3 years little use (around 25 charge cycles only). Is there anyway that it can be easily repaired? Can I open it easily and substitute the cells with new ones? What kind of cells are inside and where can they be bought?

Greatful for any hint!

Harry

While I agree, I'm looking for a portable solution to use in the 'yl's vehicle so I can run a decent rig without drilling. I figure 10-20W is adequate (I think the 1/4 wave antenna I have allocated for this use is only rated at 20W anyhow). In a small temporary installation like this I think using the lighter plug is good enough.

Of course while on the topic, What's the best way to connect to today's side terminal batteries? I'd like to go from the battery's +/- in *my* vehicle to a small fuse block where I can tie in before coming through the firewall. Unfortunately I don't do a lot of auto wiring and firewall drilling!

thanks!

Auto stores will have a longer bolt for the side battery terminals or
adaptor kits if needed.
Use the right size heavy duty solder lugs for the connections.

I looked up my lighter circuit and it is 8 amps -- so 8 x 12 = 96 Watts --
at 50% or so efficiency -- should handle a 45 watt radio -- but that is
pushing it to say nothing of stray noise that may be introduced and a
possible voltage drop. Also the cigarette lighter may go thru the ignition
switching.

Somehow on all my cars I find a grommet that lets me get thru the firewall
without drilling.

Just looked up the current draw of an ICOM IC-2100H -- tis 12 Amperes on 50W transmit. Their IC- V8000 draws 15 Amperes at 75 Watts transmit. I wouldn't connect either of these radios to the cigarette lighter plug.

That was my thinking. As a note, I was just talking to a buddy of mine with an Excursion. His "lighter plug" is actually labeled "accessory plug" and had a 20A fuse in it from the factory. That tool replaced it with a 30A fuse so he could run his inverter rated at 25A. We won't discuss that call any further.

> Somehow on all my cars I find a grommet that lets me get thru the firewall
> without drilling.

That's good to know. I'll have to poke around a bit more and see what I can find in my 2002 Impala. I did have real good luck this afternoon on my '97 Silverado 2500. The previous owner had already run 12g through the firewall, so I had a hole to work with. I rewired it primarily because I wasn't sure what he had done - it was a bit confusing.

Anyway, on the Silverado there are two "taps" - basically large studs - along side of the fuse box. Each stud is hot and fused right in the box with a 30A fuse. I made up a couple of cables and ran these right into the cab using the existing hole. Found a good ground spot right on the firewall, so it's nice and short as well! Both cables are about 5' in length. Of course while these studs look stock (the fuse box cover actually is molded to fit right over them) they might not be, so if you happen to have a Silverado and don't see these studs don't blame me!

I'm sure the Impala won't be quite as easy.

I looked at my Yaesu 5100. It has 12A fuses, but my power supply reports
it's only drawing about 6A on "high". My Diamond meter reports it's only
putting out about 20W on high on 2M, and a bit less on 70cm. Obviously
both of these numbers are suspect since I haven't had either device
calibrated, but I think I'm safe in this case.

Now when my new Yaesu 8800 gets here next week I'll have another data
point to check both the power supply and power meter against.

John,

Well, I use a Power Station (12vdc battery pack) in my car. I mounted my Yaesu FT-1500M to it, put the charging cord into the cigarette lighter, and it works fine. Plus, I can remove the battery pack and rig within 60 seconds for theft deterence. I run the rig up to 50 watts out but generally at 25.

73s,

Evan

That's actually a pretty decent idea. What's the draw on that battery
charger, and how long does the battery hold up if it's not plugged in?

One choice I've resorted to on a number of installations in sedans is to locate where the major cable bundle on the driver's side firewall goes through. It is usually embedded in a very large rubber seal. I usually can take a sharp flat bladed screwdriver and poke a hold in this rubber, being careful not to hit the cables in the center bundle. Poking a #14 black and red wires through this new slot is not difficult and usually provides adequate power from the battery to most dash mounted radios and other equipment.

I have a KDK FM-2033 mobile rig that I just got. I need to know how to set the PL tone. Upon opening the case I can see the tone board. There is a pot next to it labeled "tone" as well as a pot on the underside of the tone board itself.
Which pot do I use?
How do I tell what the current frequency _is?_

I hope someone can help me...
-Greg Courville

Greg,

I owned an FM-2036 (I think?). That would be from the early 1990's, right?

Almost always, the PL tone frequency is set by a switch (not an
adjustable control). The one you are looking at might be a setting for
how loud it transmits the tone, not what frequency it's at.

Look for a set of dipswitches, probably a 4-position one, might be 6- or
8-position.

All the best, and 73,
Dave KZ1O

I was told (I'm the previous owner) that on this particular radio, it has
only a single tone, and that tone has to be set via the pot on the tone
board. I never attempted this, as we don't have repeaters here, hence no
need for PL's.

Normal level standard is .7 or 700 cycle deviation. Without a deviation monitor you can not set this with accuracy. Suggest you listen on the repeater with another radio. And after you get the tone frequency set you adjust one pot or the other to determine when you bring the repeater up. Adjust it for minimum needed to do this.

Now to set the tone freq you will either need a frequency counter of a system monitor. Ask around to the local hams for help on this one.

A simple way to determine which pot is the level pot is to get a thin metal screwdriver hold it in your hand. Listen to the output of the radio in another one and touch the pot on the metal connections with the screwdriver. With the rig keyed of course, and audio adjusted in the other receiver so it dont squeal. Your hand will cause a hum or a scratch sound in the OTHER receiver. That will be your LEVEL control.

It looks like the pot on the tone board itself is the frequency set pot.
Would it work to remove the existing pot and use a rotary switch to connect
to one of several external resistors?
I can measure the resistance sweep of the existing pot, then fabricate a PCB
with, say, 4 or 5 similar pots, so I can switch between them.
Alternatively, I could run banks of resistors thru dip-switches, to adjust
the frequency in a binary-style fashion.
Does anyone have any comments on these methods, or suggestions?

Thanks!

Well, I paid $50 for the radio itself. I'm running on a non-existent budget
here and would prefer to build, rather than buy, what I need.
My concern with running the pot lines to an external box is the possibility
of interference.
Any insight?

Greg,

I suspect that you should not have any problem with an external switching setup if you use shielded 600 ohm mic cable for your interconnect, and ground both ends of the shield. This should be no problem as long as the low end of the original pot is at chassis ground. If this is the case, run ground to shield, red to high end and white to wiper, and you can use a 12 position rotary switch and pots in an aluminum project box. Make sure you ground the project box to the shield, this will keep out RF. If you're clever, you could use a series of resistors on the switch (you want a NON-Shorting switch) with one end at ground and the other at the high end, and use the switch wiper like a pot wiper...

Somehow I just think that with such low level tones, and wires going to
switches
and resistors, you will have a tough time getting the accuracy required of
the tones to
be reliable.
But, I suppose everything is possible.
Let me know if you have any specific questions on the rig. I have one as
well.

Looking to trade my near "mint" FT920 for either a Kenwood TS850SAT or TS570SG

The 920 is about as mint as you can get without being new. Comes with manual, and standard hand mic. I will keep the power cord as it has been shortened. The radio will be shipped in it's original shipping box and boxed again. Just looking to get back into Kenwood gear. I can send photos to interested parties.

Please reply direct ve3tmt@rac.ca

IF the person still needs help with this, I believe I still have a manual I
can help with.... It seems to me, I've repaired one of these in my past.
Also, I "THINK" the party who said it is a pot adjusted for tone, may be
correct. C.L.

>Hi all - What is the current price new retail price for such a rig with the
>usual accessories but no extras in the US?
>I'm in South Africa and am looking into wether its cheaper to import myself
>or use a local dealer

$799.95 at AES (www.aesham.com)
$769 at Gigaparts (www.gigaparts.com)
$749 at HRO (www.hamradio.com)

Right now the IC-706MkIIg includes a free remote mount kit. You'd have to visit
the websites for information on the shipping costs.

Sorry to hear about your fire.

A couple of sites to look at:

http://www.rigpix.com

This will help in IDing specific models, very limited pricing, though.

www.qrz.com
www.eham.net
will have other info.

eBay may be helpful for establishing current selling prices. They tend
to be on the high side, but that should not be a problem for you in
this situation.

I got a Garmin Streetpilot as a present from a Canadian co worker to experiment with in combination with my transceiver (GPRS).
As I live in Belgium I can't use the built in map (USA). Is there a possibilty to change the software in the system in such way that it will show Europe instead of the USA ? I noticed on the Garmin website that there are two SW upgrades (http://www.garmin.com/products/streetPilot/download.html) available. Can I just replace the "Americas" package with the "Atlantic International" package ?

Kind regards,

KrL

I wonder how one might be able to use a 1-3 farad capacitor to operate a 100 watt HF radio with better regulation and higher average current on SSB.. The big audio amps use this technique effectively.

This Modified Bearcat 3000 xlt will receive Tetra/Tetrapol/Apco
It will not demodulate or decode but it does scan and receive !
It has a built in dual-mode signal strength meter.
In addition it will also detect frequency-hopping and spread-spectrum
and videosignals in fact it detects everything that causes a electromagnetic radio-field
(between 25 and 1300 mhz).
There is a "nearfield detector" inside
It's a perfect "bugdetector" at the same time.
It still works as a normal "old fashioned" scanner at the same time !

Message-ID: <b1D0b.356$IY5.269@fe01.atl2.webusenet.com>
Source record: 27440

I have finally succumbed to purchasing an electric scooter in order to increase my mobility. This is not a child's toy scooter. It is the type that those with walking problems use in order to get around.

I have been thinking of ways to make this a truly mobile communications center. At the moment, a Diamond Disconne antenna, which I have, and a Yaesu FT-817, which I do not have, are very appealing to me. I can't help but wonder if anyone else has tried something like this, and what, if any, problems they may have had with RF getting into the scooter's control system. Your thoughts will be appreciated.

Turns out, as I just noticed, one of the previous owners soldered a little wire to part of the tone board as a test point. From here I've been able to probe with the o'scope and note the frequency change with adjustment of the pot. Next I'll draw up a PCB to hold a several pots and a swtich, to switch between the tones.

I'm a new Tech-class, KG6SGY, and I'd like to take a shot at DXing.
First of all, could someone reccommend a band and mode for a beginner like me to start out on? I'm willing to take the code test or even upgrade to general if need be.
Second, does anyone have an HF rig they would be willing to sell at a relatively low price? I only have a little over $55 to my name.

Thanks!

-Greg Courville

There is no way to replace the built in map (base map)
You can however load the detailed maps of Europe on the memory card
(did you get one?) to get street level maps and door to door routing,
I hardly ever need the basemap.
You can also do all the SW upgrades that are on the Garmin website,
they are for all versions of the SPIII and concern routing and display
options rather than basemap stuff.

Good luck.

Greg -- I recently saw a Swan 350 on e-bay for $40. It may have required some work.

Go to swap meets or swap pages and look for one of the older rigs -- Swan 350, Yaesu FT-101's, Kenwood TS-520S, etc.

Repair or look for an Elmer to help you.

These older rigs will get you on the HF Bands (less 12M, 17M, and 30M)

You will need to take the code test (gets you on 10M SSB) but 10M is pretty poor at the moment). Technicians who pass a 5 WPM Morse code examination are entitled to limited power outputs on certain HF frequencies. "Technicians with HF" may operate on the 80, 40, and 15 meter bands using CW, and on the 10 meter band using CW, voice, and digital modes.

So a general ticket may be in order, then you can work CW or SSB on 80,40,20,15, and 10M with one of the older rigs.

Antennas are easy to homebrew for a few dollars.

Good luck and congrads on the new ticket.

DXing can be addictive but a rush for sure.

I'm looking for the technical sheet of this device, in particular
instruction to how to set frequencies by diode matrix.
Excuse my bad english.
Please contact in mail or on it.hobby.radioamatori newsgroup because I'm
italian and I don't have the subscription to this newsgroup.

Thanks in adnvance to everybody.

Best regards

Genio Dj

DX means different things to different people. With a Tech license,
you can operate 6 meters and up. It's possible to work a few hundred
miles on vhf/uhf using ssb with a good high antenna and favorable
conditions.

If you get your General license, you can operate all the HF bands. At
this point in the solar cycle, 15 and 10 meters aren't too great. 20
and 17 meters are the best bets for working DX on ssb. At night, you
might also try 30 and 40 meters on cw.

$55 won't get you much in the way of equipment. If you're willing to
operate CW, you may be able to pick up a vintage tube-type rig at a
hamfest. With 50-100 watts and a simple wire dipole, you will be able
to work a good amount of DX on CW.

Check out the local ham clubs in your area. Some of the old timers
will likely help you get started, and perhaps lend you a rig.

See:
http://www.qrz.com/clubs.html?

Good luck,
Art Harris N2AH

Not easily... the only procedure that could work is reprogramming the
internal memory chip, which would require desoldering it.

I'd appreciate any comments, pro and con, from actual users of the IC-706MKIIG. Performance, reliability, service problems, etc.

As it's described it seems to have features I'd like and need: small size, both HF and VHF, and a reasonable power level. Any suggestions as to other rigs with similar features would be appreciated also.

The big audio amps need very short pulses of power, and they combine
the large capacitor with the heavy gauge wires mentioned:

> "Keyboard In The Wilderness" <KITW@forest.com> wrote in message
> news:nhL%a.4824$S_.966@fed1read01...
>> John FYI -- from a recommended book:
>> always best to run two heavy gage wires ... directly to the battery

Perhaps a capacitor would be helpful if doing CW rather than any
modulated carrier scheme with its longer power demands, but most
radios seem to have sufficient capacitance if your power wiring
is sufficient to meet their average high demand.

The XYL and I run one in the mobile rig. Performs very well in all
manners. Using a hustler fold over with the resonators we have worked a
lot of states and counties from the pickup. It has a good noise reduction
system and a fair to good noise blanker.

I don't think they would bother with a code Tech license anymore, since the
only difference between the old code Tech and the General was the difference
between 5 and 14 WPM code... now that the General only requires 5 WPM, no
point in the code Tech...

Seems to be the best deal for the money. Had mine for a couple of years and
like it for what it is. I have not sold off my other rigs but have a Yeasu
757 for the low bands and other rigs for VHF/uhf to compair it with.

I've had both the original 706 and have had the MKIIG since 2001 and the MKIIG is a great radio. I use it as my base radio. I love the radio, but the only thing it doesn't have going is the ability to be programmed by PC. At least I have yet to find a decent program for it.
There is much better software available for the Yaesu radio's. It makes it a lot easier to program all the channels, if you're using for other than HF. I use it for all the bands, so PC programming would be nice.
But like it just the same.
That's my 2 cents worth.

Lou

the deal I had with a guy for this radio fell through, and I am again looking to trade my beautiful yaesu ft-847 for a Kenwood Ts-2000, the 2000 don't have to be as beautiful as this radio is, just working like it should and looking decent.

thanks to all the guys that made offers of a trade while I was waiting on the child on the deal that fell through, I am sorry for not taking each and every one of them....but write me back, and we will see what we can do this time.

thanks very much, and I have pictures on request, this is a beautiful little rig!

73!

At the moment from the ARRL:

Technician Class

Hams enter the hobby as Technicians by passing a 35-question multiple-choice examination. No Morse code test is required. The exam covers basic regulations, operating practices, and electronics theory, with a focus on VHF and UHF applications.

Technician Class operators are authorized to use all amateur VHF and UHF frequencies (all frequencies above 50 MHz). Technicians who pass a 5 WPM Morse code examination are entitled to limited power outputs on certain HF frequencies. "Technicians with HF" may operate on the 80, 40, and 15 meter bands using CW, and on the 10 meter band using CW, voice, and digital modes.

May change soon or may change latter -- unknown at this time.

For the General class (From The ARRL:
General Class

The General Class is a giant step up in operating privileges. The high-power HF privileges granted to General licensees allow for cross-country and worldwide communication. Some people prefer to earn the General Class license as their first ticket, so they may operate on HF right away.

Technicians may upgrade to General Class by passing a 5 WPM Morse code test and a 35-question multiple-choice examination. The written exam covers intermediate regulations, operating practices, and electronics theory, with a focus on HF applications.

In addition to the Technician privileges, General Class operators are authorized to operate on any frequency in the 160, 30, 17, 12, and 10 meter bands. They may also use significant segments of the 80, 40, 20, and 15 meter bands.

In the olden days, the Technician and General written exam were the same.
The only difference was the step up from 5 wpm to 13 wpm in the examination.

I'm not sure, without taking the code test, a Technician licensee is
even allowed on the HF bands. Your best bet would be to continue to
upgrade -- get your General Class license -- and in the meantime save
up a couple of hundred dollars. Then you can get a serious HF rig,
altho' an older, used one, and try your hand at DX on bands like 20
meters and up.

Look at what some of the older rigs are going for on Ebay, and that
will give you an idea of what's out there, and how much it will cost.

The older Kenwoods, Yaesus & Icoms are probably the best way to go;
some were all solid state, some were a mix of tubes and transisters.
Just look around...

I am using the 706MKII (not G model) mobile and have had great results with it.

I have used it with a Webster Bandspanner antenna and also a hamstick antenna. I am currently using it with the AH-4 antenna tuner and the 20m hamstick and results are good. The advantange, of course, to the tuner, is I can instantly change bands on the antenna system at the push of a button.

I have also used my 706 in a portable operation. Last year, I went to the island of Bonaire on vacation. I packed my 706 in a foam padded briefcase along with a small tuner, a switching power supply, and carried a homemade 20 meter dipole. Had a great time, LOTS of contacts all over the US and Europe.

I got one a couple of months ago--they've dropped the price
and I couldn't resist. I got it really to work 6 meters but
wound up putting it in the car instead. I am REALLY impressed
with it. The DSP/auto-noise-reduction stuff seems to work
remarkably well (I've never had it before so I'm not a very
serious judge, though.) The menu system is pretty easy to use
even in the car, and the memories are darned nice--they store
power level among other parameters, so I can switch between the
local repeater and low power, and 70 watts on 20 meters, just with
the flip of the knob. VERY nice. I've only owned 4 HF rigs in my
entire 14 years as a ham, so I'm not very experienced with rigs
in general. But I've been DELIGHTED with the 706 MkIIG. If I
ever get bored with HF mobile I'll probably bring it inside for
my main SSB rig and use my FT-840 for PSK and CW. Feel free to
email me if you have any specific questions .. GOOD LUCK!

| repaired? Can I open it easily and substitute the cells with new ones?
| What kind of cells are inside and where can they be bought?

I've never seen that particular battery pack, but the answer is most
likely `yes'.

I found this on it --

http://www.chq-inc.com/IACCESS/BP-199.html

So, if it's 6 volts DC and 700 mAh, it's probably 5 cells. If it's
700 mAh and NiMH it could be AAA cells, or N cells. The former you
can buy at Wal-Mart, the latter are harder to find.

Crack it open and see what you've got.

Replacing batteries in packs like this is easy with a little practice.

As for soldering the pack together, be sure to have a large soldering
iron -- at least 60 watts -- with a big fat tip that will hold lots of
heat. You don't want a soldering gun -- they don't store enough heat.
Also get some desoldering braid -- it makes a wonderful wire between
the cells.

Here's some good instructions --

http://www.dynamoelectrics.com/How-To.htm

You need a big iron because you need to be fast -- only touch the cell
for 2-3 seconds or so, tops. Any more will damage the cells.

Soldering on batteries is a no-no, but you're gonna do it anyway...
Get some extra cells to replace the ones that vent and go bad after they
were overheated. If you've never done this before, you're likely to
fail. So practice first soldering on the dead cells.

Take a close look at how much space you have in the plastic.
Often, the cells fit so tightly that there's no room for the solder

joint and wire. Check out the space before you go soldering on perfectly good cells that won't fit.

Cells with tabs
will solve your problem if there's room to solder on 'em.

No flames about soldering, I've heard 'em all.

At the risk of stating the obvious, have you tried to revive the pack? Depending on the cell technology, discharge each cell individually to 1.0V then recharge 'em. Maybe try it more than once. Sometimes works. Sometimes you have one cell that's shorted. You can blast the short out with a charged capacitor. The cell will have poor shelf life due to leakage, but if used/charged regularly can have useful life.

If done carefully, it won't damage the cells. But you need to be
fast!

What really should be a no-no is charging $60 for a battery pack with
$10 worth of batteries in it :) You really can save a lot of money by
reloading your old battery packs with fresh batteries.

| Get some extra cells to replace the ones that vent and go bad after they
| were overheated. If you've never done this before, you're likely to

That's not a bad idea. Do your practicing on some old alkaline cells
of the same size (hopefully they're AAA) if you can -- that way, you
can practice even more. You need to be fast!

| Take a close look at how much space you have in the plastic.

hi, marty. i've got a MKIIG in my camper and use it when
camping...not as often as i'd like. no problems with it at all. it
performs well. i guess the only "complaint' i'd have is trying to
remember all of the functions. but that's a problem with most moden
rigs.

Well, Martin, I use mine in my Semi truck, getting beat up by the Arkansas, Michigan, Pennsylvania, New Mexico, Arizona, and California roads all the time as I roll on delivering freight. It's never let me down once. One comment, though, if you plan on using it while rolling, the narrow SSB filter is almost a MUST. Makes listening through the "tire static" (yes, it really does exist. I have proof.) much easier.

Hi all,
a friend of mine (G4OOK) has decided to sell off some of his radio
collection.

At the moment he has an ICOM-R71 complete with all options and filters, he
wants, £250.00
He is also selling his Eddystone-950/6 (CW AND SSB only) RX, he wants
£200.00 for it.

If anyone is interested in either of these radios please contact me direct
(Stewart, G4OOK is eighty
two years young and not into the workings of the net).

Cheers all from Ken in the UK, G4KIR

Yes it does exist. I bet the greater bulk of the noise I get at road speeds is tire static. If I stop, even with the engine running, it's pretty quiet. But at highway speeds, my noise will jump up a good bit. I've heard of various cures, ranging from anti-static powder in the tires, to springs you insert in the wheel bearing caps to make a better electrical connection across the bearings I presume. I've never bothered trying any of them yet. I just turn on the NB... MK

Thanks for all of the comments and references. Obviously it's a well thought of rig. I think it will suit my needs nicely.

After 41 years of hamming I decided give it up and recently sold, gave away and junked a 50+ year accumulation of stuff. Made the xyl deliriously happy.

Here we go again!

I posted this on alt.radio.amateur (looks dead)...

I recently lost a TS-870S to a lightning strike (tower, rotor and coax as well). Anyway, does anyone have experience with both radios that can offer some opinions of which they would buy? I know it's a Lincoln vs Cadillac comparison, but I'd appreciate comments.

Jim

2466. Motorola Visar I or II, how to identify ?

I have used it on 40 meters successfully and on 15 and 10. The SWR is perfect. The efficiency of the system is not so good. I can do the same thing with my Webster BandSpanner. My biggest problem is being mobile when there is a band opening. Havn't found that many on 15 & 10 recently....at least when I have been in the car.

With the AH-4, it really doesn't matter what I put back on the antenna mount. It will find he L/C combination and match it to the radio (within reason of course...obviously can't use a 1/4 wave UHF spike on 40 meters). I have been looking around for a 102" CB whip. That would work as well as anything.

Try Radio Shack for the 102" whip.. they still sell em

Oh, and for kicks, you might want to chuckle at my insanity while
looking at a similar setup at http://www.csotbs.org/ai8w/TruckPics

I sold that truck, and haven't had a chance to reconstruct that system
on the new truck yet, but it's coming.

I'll pass along your posting to someone who has had both. I don't know
if he will respond but I'll give it a go.

By the way he still has the 870, but not the proII. I don't know what
the reason is. The PROII looks to me as a fine radio, in fact if I
dident own my great 775 I'd have a PROII sitting here.

I am sure RS sells them. I was just looking for one at a flea market,
or hamfest or something for a few bucks. I am not in desperate need of
one just looking to try it out for comparison purposes.

Tried the link below and it does not work.

Got the correct URL. Interesting config. I notice the antenna is pinned over, looks like either wire or string. If its wire, is that part of the radiating element???

The pic made me think of my first computer/radio setup. It was a Commodore Vic 20 with a Kantronics TU. This was when interfacing computers to radios was the newest thing. I invited a friend to the shack showing him the RTTY and CW capabilities. I tuned into a 20 meter CW QSO. As we sat there watching the message on the screen at 20 wpm, the operator was in an 18-wheeler on the interstate (somewhere). A week later, my friend had a computer hooked to his system.

2474. GAINESVILLE TX. HAMFEST 8-23-03

Come on over to the Gainesville Texas hamfest this saturday! Flea market opens for early set-up at 5am saturday morning and general public is in at 7am!
All you radio operators in north Texas and Southern Oklahoma load up all your unused radio gear! There will be indoor tables for $10.00 and outdoor tailgating will be a mere $6.00
The location is the Gainesville civiv center which it located right off of I-35 at the California Street exit on the west side of I-35 directly behind the Taco Bell.
Talk in is on 147.340 or 442.775.
Let's make this a great event! COME ON DOWN!

Yes.. If you would read the description paragraphs, you would have found out that from the feedpoint of the one 102" whip, to the end of the other 102" whip (insulated from ground) is 40' of wire. it was all part of the radiating element.

I didn't even see the rest of the pics. When I scrolled down, I saw
them. Guess you get a lot of comments at the truckstops from the other
drivers????

Certainly not an antenna configuration for someone driving a Ford Focus.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3041718873

This auction is for an Astatic D-104 desk microphone with the K0SF amplifier board installed and wired for an 8 pin Icom radio.

While this microphone does work great, it is an "ugly duckling" - there are 2 holes drilled in the base and the base has been painted black. This was all from its previous life as a CB mic. :(It has been rescued from that and is now a serious ham mic!

This product is in working condition, but is sold strictly "as-is" because that is how all electronics gear is sold on ebay these days.

High bidder will pay within 10 days of auction close by either PayPal or money order. Shipping charges will be the actual charges from 03051 to your destination for 3 lbs. through Priority Mail.

Hurry! Auction ends Sunday afternoon!!! Current bid is $10.49

Thanks for looking.

Russ KB1GKN

2480. FS:NOS JACKSON BROS. Vernier drive 2-Section CAPS NEW w/pics

<< I recently lost a TS-870S to a lightning strike (tower, rotor and coax as well). Anyway, does anyone have experience with both radios that can offer some opinions of which they would buy? I know it's a Lincoln vs Cadillac comparison, but I'd appreciate comments. >>

Jim-

I've had the TS-690S for several years and recently purchased the IC-756 Pro II. Your TS-870S is probably closer to the Icom with respect to performance. No doubt the Icom has some advantages with its DSP IF and spectrum scope, but there is more to a radio than that.

My main complaint is about the lame memory system in the Icom. For they charge for the radio, there is no excuse for it. Perhaps most people don't use memories in an HF rig, but since they are there I tried to use them for several repeaters in the area. Not only is the memory not able to store both transmit and receive frequencies, it is totally unaware of whether the radio was set for split operation. Thus it isn't aware that there are other standard offsets in use, and requires you to manually change it when needed.

Other than that, I really like the spectrum scope. That was the main factor that made me choose the Icom over the Kenwood TS-2000.

Marty,
I had a '706 for about a year in the mobile. It did exactly
what it claimed it would do and isn't a bad radio at all. I had
a problem with the programming, etc., just too 'busy' a radio
for
~me~ to use in the mobile. There were some things that if I
wanted
to change, I had to pull over and stop to do. I also didn't
have
much use for the VHF/UHF sections, just didn't do much up
there.
So, I swapped it for another radio (like I'd had before the
'706).
The '706 is a nice little radio with the emphasis being on
little.
I was really happy with some of it's features, but just too 'fat
fingered' to keep it.
'Doc

Hi, What I've heard is that the newer ICOM's are very susceptible to ESD, let along a direct lighning strike. Not much can survive that. While searching for a radio, I checked the specs as published by ARRL and both are comparable. The interesting thing is that you see very, very few used TS-870s floating around and the amount that they have depreciated versus an ICOM, is less. That doesn't mean it's a better radio but it seems the radio is kept by the owners. I have also heard that the more sophisticated ICOM's aren't all that reliable. Having said that, I owned a 756 (not a pro) and liked the performance. The cost of long term ownership troubled me when the display failed and found out that Sanyo (the display manufacturer) no longer had these or the display driver chips available and that ICOM had only 3 left in stock. Being that this was a chronic problem, I would have expected ICOM to take care of this issue but they don't. It is therefore possible that in the next few months, there will be a lot of 756's floating around with bad displays. Enough said there. I still use my 735 and have failed to note much difference in quality between it and potential replacements. In side by side comparisons made during the recent CW contest, every station I heard on my 756 (with dual CW filters) was copied on my 735. I attribute that to having full manual control over PBT and NOTCH controls. Are the newer radios better? Spec wise they should be but in real world operating conditions, I have questions.

In any case, I'm sure both the Kenwood and ICOM radios will be good choices.

Just finished parting a DX-40 that had a cooked power transformer. Here is what I have left. The pi-network and bandswitch assembly have been sold. Some of these may fit a DX-35 also. I will ship international. Shipping prices are for the USA. If you are outside the USA, e-mail me for a shipping quote.

DX-40 Panel.....$30 shipped
Some light scratches, no dents or extra holes, good Heathkit emblem

http://members.cox.net/radiostuff9/dx40panel.jpg
http://members.cox.net/radiostuff9/dx40panel2.jpg

DX-40 Cabinet.....$20 shipped
No extra holes or dents but needs repainting. No crystal door. Cabinet may also fit the DX-35.

http://members.cox.net/radiostuff9/dx40cabinet.jpg
http://members.cox.net/radiostuff9/dx40cabinet2.jpg
http://members.cox.net/radiostuff9/dx40cabinet3.jpg

DX-40 Plate Meter.....$25 shipped
Good condition. Includes the metal shield. No cracks, a few light scratches that can be buffed out with Novus Plastic Polish. May also fit DX-35?

http://members.cox.net/radiostuff9/dx40meter.jpg
http://members.cox.net/radiostuff9/dx40meter2.jpg

DX-40 Knob Set.....$35 Shipped
All knobs including knob for crystal switch on the back of the transmitter. Good condition. May also fit DX-35?

http://members.cox.net/radiostuff9/dx40knobset.jpg

DX-40 Power Supply Filter Choke.....$25 shipped

http://members.cox.net/radiostuff9/dx40filterchoke.jpg
http://members.cox.net/radiostuff9/dx40filterchoke2.jpg

DX-40 Plate Choke Assembly....$13 shipped
Plate choke, ceramic plate cap

http://members.cox.net/radiostuff9/dx40platechoke.jpg

DX-40 Tube Set.....$35 shipped
Set of tubes for the DX-40 consists of a 6146B, 6DE7, two 6CL6's and a 12AX7. All test very strong on my Hickok 605 tube tester.

Russ -

I was intrigued enough by your mention of the K0SF board to do a web search, as I was not familiar with it -- as it turns out, it is the same circuit I found inside the base of an Astatic 10DA that I had purchased on eBay not too long ago. Now I know the source of the circuit.

(For those unfamiliar with the K0SF board, it designed to allow use of the high-impedance D-104 with the old unamplified UG-8 base with low-impedance rigs).

Thanks for the (perhaps unintended) education.

Brian

From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <9HidnZ42U-iGTNWiXTWJkQ@comcast.com>
Source record: 27316

I've got a 60 hz buzz on my HF reciever. Here are the station details:

HF rig Yaesu FT-817
Tuner LDG Z11
P.S. Pyramid PS-25
Swr meter MFJ-860
Antenna 153'2" dipole, wrapped around
my 3 story brick apartment bldg.

Note - I have a VERY good station RF ground (as tested).

At first I thought the hash was coming from the power supply in
my PC but I discovered if I turn off my monitor (a ViewSonic
"perfect flat" A72f CRT) the noise goes away. The monitor is
about 18" from the 817....

I've tried to run on internal batteries, I've disconnected the
audio, key, speaker & cat cables from the 817 - no luck.

Now I do get rfi from the PC at lower freqs (below 7mhz)
and the only way I've found to kill that is to turn off the PC.

This problem is seperate, though - it's on 14.070.15 and
other freqs not as rf hash but a distinct 60 hz buzz that goes
away when I shut the monitor off.

Do I need to get a LCD flat panel monitor?

Hello Group,
I have been given a FT101ZD and matching ATU.
It is in dire need of some TLC in that all the lights are out on meter and tuning dial the digi display is ok.
Also no microphone.
Microphone I have but it is wired differently
The bulbs I will get around to replacing asap
Can Anyone let me know what the pin connections for the mic skt please

Still looking for a manual for my NCG 10/160M (Also known as a National (Panasonic) RJX-810D). I am willing to buy a used manual, a photocopy manual, or pay someone to photocopy their manual. This is a very rare radio, the Only all-band 100 watt HF rig Panasonic made. It was marketed in the US by NCG. I have repaired some of the problems with the radio but the PLL is out of alignment on 20 and 15 meters and the manual is needed to get it back to where it should be. I have repaired everything else but PLL alignment cannot be guessed-at. ANY help or leads on finding a manual GREATLY appreciated.

If a manual is not located I would be interested in selling or trading the radio for other HF gear. I will have pictures of it soon.

>I had a GAP Titan DX installed - had the same problem there, too.

Get a pair of clamp-on toroidial chokes and put them around the
monitor lead, one at the computer and one at the monitor. For one
Viewsonic monitor I had several years ago, it was required to meet
FCC data equipment noise leakage standards.

The 60 Hz modulation is probably the vertical scan (refresh) rate of
the monitor.

2502. Need pinout for KDK mic connector

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-24 17:14:46 UTC
From: Greg Courville <EngNOSPAMinuitor@Gee-Enginuity.com>
Message-ID: <vkhsknso6tshda@corp.supernews.com>
Source record: 27325
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I need a pinout for the microphone connector on my KDK FM-2033. It has the same connector as the FM-2030, the FM-4033 and the FM-7033, as well as, possibly, the FM-2016. It is a screw-on connector with 6 pins. There is one pin in the center, with five others at various points surrounding it, and there is a notch at the bottom. The microphone unit has the female connector, the one on the radio is male.

Anybody got a similar connector with a pinout for it?
Thanks!

-Greg Courville

You may need to do power cable as well, possibly serial and
parallel port cables and sound card cables depending on how
lucky you get. Six computers running here and it took a good
bit of playing with chokes to get things quieted down.

Thanks to Robert Offer for help on this one.
There is a useful diagram showing the PTT and mic. lines at
http://www.cqham.ru/trad/aeakdk.gif
From there I have figured out the following:

*-Down button (12V to activate)

*-Up button (12V to
activate)
* -PTT line (ground to transmit)
* -GND

*-Mic-level audio *-12V power (regulated to 5V inside
handset)

(looking at the male connector on the radio)

I hope this helps anyone else who is looking for this pinout.
Reply if you can't understand the diagram and I can clarify it.

Thanks all!

I have seen RFI from various combinations of Monitors and Video cards.
If you can turn off the monitor and the interference immediately stops,
it's probably the monitor.

>Do I need to get a LCD flat panel monitor?

I'm currently using a 17" LCD flat panel and have never been able to trace
any RFI directly to that monitor (which sits 2' from the Icom-746)

Hi Brian,

Thanks for your interest! If you're interested in researching it further, there is an article in the Aug 99 QST that details this circuit and this is where I got the idea to try it. It builds on earlier work by a gentleman named Fentem (sp?) whose amplifier for the D-104 is widely respected but was unobtainable when I was in the market for an amp. The author also maintains a website at http://members.aol.com/~Ampmicro.htm

Ken,
I have the same problem with a Sony 200ES, interferes the most with 6 meters, a little on 2 meters and moderate on HF. Have put on additional ferrite to no avail, like yourself everything is properly grounded. Even went so far as to put the radio stuff and the computer goodies on different lines - but ultimately they feed from the same mains. Went portable with a small antenna and found that the interference was a problem for nearly a 30 foot radius. I gave up on fixing it and do my logging on a Palm Pilot and have the pc set to let the monitor "go to sleep" after 5 minutes of no pc use. Sometimes there is little you can do aside from finding a 'quieter' monitor or not running both devices at the same time.

Hope your situation works out better than mine.

73,
Howard

The soldering iron, P/N TC201, for the subject station has burned out. The heating element is P/N TC208 with pigtail leads. A local supplier has told me that it cannot be obtained any more and another supplier that I found on line told me that they had them back ordered with an ETA of 01/31/03 so I think that they can't get them anymore either.

Does anyone know of a source?

If there is none, can anyone verify that the newer soldering iron, P/N TC201T, can be used with the older power supply? It sure looks like it can.

Thanks es 73, CJ K0CJ

Source record: 27343

Howdy,

I recently obtained a Yaesu VX-2R and I like it very much, but for some reason none of my aftermarket antennas seemed to work well on it. Today I think I finally realized well. I noticed that the center pin on the original antenna was much longer than on either of my aftermarket antennas (one a Diamond SRH519, the other a Comet nubbin). In examining the connector on the radio, the center hole looks like it is recessed quite a bit. I removed the rubber boot that is around the bottom of the antenna mount and screwed on the Diamond antenna which then suddenly began to work quite well. Apparently the center pin of both antennas was able to reach the center hole on the radio.

Which is out of spec? The VX-2R's mount or both of my antennas?

Thanks for any thoughs,
Tad

My VX-150 had similar issues with a couple of aftermarket antennas.
The counter guy at HRO said that was not uncommon with certain
combinations.

Probably due to specs being too wide, and one part in spec, towards
the one side ,and the other part, in spec, towards the other.

Standards.

Happy trails,
Gary (net.yogi.bear)

Mouser www.mouser.com stocks the TC201T iron and repair parts for it. I
don't know the difference between the WTCPN station and the WTCPT station
that Mouser lists in their current catalog (page 1027), but if the TC210T
iron is interchangeable with the TC210, then that's the place to go.
Cheers!!!

I suppose the newer iron is the one with the plug. I have both the
oooooold version and a couple newer ones, and the irons in all of them
are 24V 2A. Since all the control is in the iron itself, you should
be fine with the newer version.

You might be able to find a surplus station for less than a new
replacement iron will cost, though there is some advantage to having a
new iron with new cord and new thermal switch.

Cheers,
Tom

Some ferrite beads will help on the leads IF the problem is conducted/radiated through those wires. If it is radiated, other means may be needed (e.g. shielding).

Clair -

I have already answered this for you directly. The TC208 "sired-in" heater used in the original TCP-1 irons and early version of the WTCPN station are still available from Weller. Wassco (California) is a very good Weller distributor -- takes about 2 weeks - since they do not stock the wired in heater.

The TC201P and TC201T irons (that use the newer plug-in heater) will work with the TC202 base.

Hi All;
I have for sale a few sets of these NOS Gates brand Sub-C Batteries. They are
1.2vdc @1300mah.
Great for soldering them together for a portable QRP power pack of even a
Walkie-Talkie. Many have done so.
They have even been used in portable power tools & rechargable flash lights:-)
Price is $15.00ppd per 12.

Source record: 27255

SMA connectors were originally designed for true microwave
use ... not for 2m HT antennas ... therefore, the specs on true
SMAs should be pretty tight ...

I would guess that either the radio or the antennas have
"SMAs" that aren't close to microwave tolerance specs.

From: Joel Seidman <joel_seidmanNOSPAM@yahoo.com>
Message-ID: <3F4AE88A.2090602@yahoo.com>
Source record: 27256

I've had this nice HT for 16 years now, and it's had no problem until now. The volume control is very flakey -- only works in certain positions, and sometimes not at all. There seems to be a mechanical noise, also. Is there any hope for repair at a pracical cost? I've opened it up and it looks like I could replace the control if I could get another one. Are parts available? Or is it time to get something newer? Does the rig have any salvage value? Finally, is there a better news group for these kinds of question?

Thanks to all.

2537. What radio for home brewed repeater

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-26 13:03:27 UTC
From: jblewisoh@yahoo.com
Message-ID: <9387eabc.0308260503.5484f1f4@posting.google.com>
Source record: 27260

I'm thinking of starting a project with some of my radio friends to build our own pc controlled repeater. I'm looking for input on radios. The ouwld be 2 meter only, so that should help cut the field down, I'm looking for a cheap,rugged, highly available radio capable of very high duty cycle at 50 watts.

My initial thoughts were a pair of FT-1500M mobiles, but the receive side could even be as simple as a scanner locked on the right frequency.

I'm looking at the echolink software, and a rigblaster interface box.

I would love to hear what others have done!

The idea is that this would be a temporary repeater used for safety operations around SCCA Performance Rally events in Northern Minnesota where there is not currently any other repeater coverage. It would only be for a day or two at a time, but would see near continual usage when it was up.

I'd love to hear some comments!

Not to be too rude, but go here and read all the info and then come back and
ask questions.

http://www.repeater-builder.com/rbtip/

The normal ham transceivers will not cut it and the scanners are not well
shielded and very selective in the RF stages.

Old GE and Motorola units make very good starting points for the RF part of
a repeater.
You may want to go to the 440 band as the duplexers are easier to find at a
reasonable cost.

2540. Azden PCS-6000 VCO Adjustment

Newsgroup: rec.radio.amateur.equipment

Can anybody tell me how to adjust the Tx VCO for this transceiver. There are two VCO coils inside of the shielded enclosure.....one for the Rx, and one for the Tx. I do have a schematic diagram, but unfortunately, the coils are not marked. I called up Azden, but they tell me that the person who used to repair these things is now retired.
A pictorial of the adjustment locations would really help. Thanks!

Pete

2541. Added a few turns...

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-26 14:59:00 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <38qcnUXRrdYn6NaiXTWJhA@comcast.com>
Source record: 27264

I was running my dipole with a 6 turn, 2-5/8" dia rg8x coax choke
at the feed point. I got the following "dips" on my SWR meters:

2.330 mhz, 1:1
8.000 mhz 1.8:1
23.615 mhz 1.2:1

A message I got specified that at 6 turns (2.342 uH), I might want
to consider adding a few turns. I added 3, for a new inductance of
4.132 uH. Now I get the following "dips" in my SWR meters:

2.330 mhz, 1:1
8.040 mhz, 1.8:1
13.630 mhz, 1:1 <<<new!
23.615 mhz, 1.2:1

I didn't add any coax to make the turns - I simply used the slack
in the line I had to wind the turns. I can't wind any more without
adding coax at this point.....

Anyone know what's going on here? FYI the antenna is a 153'2"
dipole wrapped closely around a brick building. The feedpoint
is on the third floor window, the ends are 1) chest height and
2) 10' high. Everything is very well grounded (covered here
before)......

GE Master Pro and Master Exec radios are good for repeater use. They
can be broken down into individual elements which can be replaced and
repaired as needed. Use the output as an exciter for a solid-state
PA.

2545. MFJ-9020 -- reducing WWV interference?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-26 20:39:45 UTC
From: k5dh@raytheon.com
Message-ID: <IAP2b.138$612.1523@dfw-service2.ext.raytheon.com>
Source record: 27268

MFJ-9020 users...

Has anyone come up with an effective way to reduce or eliminate the interference from WWV? I hate having that constant high-pitched heterodyne in the 'fones. How about a 10 MHz trap at the antenna connector, or at the input to the receiver section? I thought about moving the i-f off 10 MHz a little by using a matched set of crystals, but that could get a bit expensive. I'm open to any reasonable suggestions.

Please don't waste my time and your time telling me to junk the 9020 and buy an FT-817 (which I already own and like very much) or one of the myriad of other QRP rigs on the market. I want to make the 9020 work, just because. Besides, I like tinkering with QRP rigs! :)

Both frequencies mentioned, 10MHz and I thought 6.144MHz (though
I can't remember what it's used for) are common frequencies for
crystals, so they are a commodity item, and inexpensive. You can
get them cheap, and if you need to go through a bunch to get a match,
it won't cost too much.

Moving to some specific frequency likely will mean expensive crystals
because they will need to be custom made. If you move the existing IF
frequency far enough, you'll then have to start messing with the rest
of the circuitry. An obvious choice would be in the 9MHz range, because
there were plenty of CB crystals in that range. 10.240MHz is common,
and cheap, and maybe that is close enough to not cause other problems.

I don't know what the rig is, I don't suppose it's a mere receiver?
If so, then an obvious choice would be to get one or a few 10MHz crystals,
which are cheap, and make a simple filter that goes between the antenna
and the receiver. Even if it's a transceiver, the scheme would work
so long as a point after the TR switching was located.

Mind you, a front end filter won't solve the problem if the signal
is getting into the IF directly. If the unit isn't shielded well,
this might be the problem. And if it is the problem, a filter between
the antenna and the receiver won't do anything because the signal is
completely bypassing it.

One good source for crystals and oscillators (I've bought from them a
couple of times) is www.calcrystal.com. They have a pretty good
selection of crystals in stock, including 8.984357, 9.01120, 9.60000, 10.2450,
10.5000, and 10.6200 MHz.

For surplus crystals, try www.alltronics.com - he has a whole bunch in
the 9 - 11 MHz range, for all of a dollar each.

2553. WANTED - Will pay $100 for Lafayette Explor-Air kit radio

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-26 23:51:12 UTC
From: padawer@mindspring.com
Message-ID: <edd286fc.0308261551.54e5dd43@posting.google.com>
Source record: 27277
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

My first radio as a kid in the mid-1960s was one my father bought for me -- a Lafayette Explor-Air kit radio. He built it, and I used it well. It was a three-tube regenerative unit for AM and three SW bands. It was Lafayette model KT-135, and it looked like this: http://hometown.aol.com/kc0imn/explorair.jpg

Osterman prices it $25-35 (Shortwave Receivers Past & Present, p. 255). There's another pic there as well for those who have the book.

I would very much like to acquire one unit, working if possible (although I would be happy to acquire one even if not), to present to my father at an anniversary event in December 2003. I will pay $100 plus shipping to anyone who has one they're willing to unload.

Thanks very much!

Hmm, my little qrp ten-tec 1320 has an IF of 6.144 mhz. The rig has
six HC-49 style crystals at that frequency, and they don't look that
expensive. (Whole rig only cost $95.)

Comet CFX 514 Triplexer, low loss, high power.
New condition with packaging, velcro (unused)
& manual. 1 SO239 common, 3 PL259 pigtails.
Handles 800 w @HF, 50 & 144 mhz, 500 w @
430 mhz (PEP). Pictures available upon request.

Outputs:

1.3-90 mhz with 0.2 db insertion loss
130-200mhz with 0.25 db instertion loss
380-500mhz with 0.3 db insertion loss

Pics available upon request.
New at Gigaparts $79.95 - it's un needed
equipment at my new Colorado QTH.

Asking HALF of new price - $39.95 + $5 shipping

2558. FS Nice Yaesu FRG-7000 Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-27 14:55:39 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <LD33b.44491$0u4.33450@news1.central.cox.net>
Source record: 27281

I have FS a very nice Yaesu FRG-7000 Communications Receiver. This receiver sold for around $600 when new and was the upgrade to the FRG7. It has a digital frequency readout and a digital 24 Hour clock. It works and looks great. It is very stable and receives SSB exceptional well. Price is $275. Thanks, Charlie Hugg, K5MBX

2559. FS: ZM-3A/U Capacitance Analyzer and Coax Relays

For Sale.....ZM-3A/U Capacitance Analyzer.....$165 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have
a manual , however they are available
from several sources on the internet

Photo:
http://members.cox.net/radiostuff9/zm32.jpg

Also have a bunch of Coax relays - BNC type.....$16 shipped in USA
(outside USA is higher)
These are rated to operate on 26 volts DC (kicks in fine at 24 volts).
These are good through VHF frequencies and possibly higher.

Photos:
http://members.cox.net/radiostuff9/coaxrelay.jpg

I thought I would post a followup on this...
I deceided not to try and take the HT as a carry-on and just put it in some checked in baggage - on both flights out and coming back though the suitcase was checked by TS and they left a little card indicating that they had checked it. I also had some battery holders with the HT that had alligator clips on the ends along with a MAHA charger - I am sure seeing the jumble of wires and alligator clips and a taped together Nicad pack for the FT-50 got them excited :)

2575. FS: U.S. Tower TX489 MDPL 89' Telescopic tower

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-28 01:46:47 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <bad3b.6767$Jh2.1125@newsread4.news.pas.earthlink.net>
Source record: 27198
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

U.S. Tower TX489 MDPL 89' telescopic tower. Tower retracts to 23'4", five sections, 25.6" bottom section top section 12.5". Weight-1800 pounds.

Concrete base size 5'x5'x8'. Wind load 18 square feet.

This tower includes coax arms, limit switch system, thrust bearing, new base and bolts. This tower uses the heavy duty motor and cable system to raise and lower the tower. This tower is up and operational for a demonstration of the motor and cable system.

Professional removal available but not included in the sale price. Tower can be loaded onto a truck at the time of removal if desired. Trucking/delivery arrangements are the responsibility of the purchaser.

Asking $4500.00/OBO

Contact Rich W6VX here or at 818/257-2578

2576. Re: Any hope for my Icom 03AT?

Hi Joel, call up the Icom parts dept.
They have tons of volume controls.
They use the same control for many HT's.
Just 3 weeks ago I received a new volume
control for my 02AT.
My old control only worked in a certain spot about 3/4 up.

Good Luck!
73, Mark

2577. ICOM IC-T7H or IC-W32?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-28 05:38:59 UTC
From: Stix <pipestix@hotmail.com>
Message-ID: <myg3b.20999$S_.16896@fed1read01>
Source record: 27200

Hey gang...

I've been off the air since my radio was stolen a few years back. Now I'm looking to scrape together a little cash, buy myself a handheld and car antenna, and get back to a little 2M activity.

I went browsing at the local HRO, and spoke to a gentleman who recommended for my budget the IC-T7H and a particular glass mount antenna. After flipping through a few catalogues, I'm thinking I might want to save a little longer to get the IC-W32.

What are your opinions on this? Any experience with either radio? Is it worth the extra or should I stick with the T7H? I will be using it in the car and the backlit number pad would be very convenient, although I'm sure after setting my pre-sets I won't need to fiddle with it much in transit.

Any and all opinions/suggestions/comments are welcome. Thank you in advance for your help.

Message-ID: <bikj09$80a$1@eol.dd.chalmers.se>
Source record: 27202

I have problem with my 70cm rig, an Icom IC-448. I have used
it for packet radio about ten years (running 24/7) and
suddenly the squelch have stopped working. I have no schematics
but know, from the manual, in what area the squelch circuitry
is and have looked at the voltages there. But I am not that
much wiser from doing so. Pressing the monitor button will
open the squelch after an initial period, acting as if a capacitor
is charging up. But normal squelch does not work at all.

Anyone who have had this problem and found the cure for it?
Anyone who have a schematic?

2580. Loosening coil slugs in tube-type CB radio?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-28 15:08:12 UTC

I am restoring an old Kris 23+ tube-type CB radio.
As with most Japanese-made CB gear from that era,
the coil slugs are held in place with some sort of
glossy white paint-like sealer. How do I dissolve
that sealer without damaging the coil forms? I'm
unable to budge the slugs with a diddle stick, and
I don't want to risk fracturing a slug by trying
to force them.

73,

Usually a drop of solvent will loosen them. If the coil
forms are plastic it might be a problem, but you can test the
solvent on the end of the form first.

try alcohol first for solvent, it should not mangle coil forms. if that
doesn't work, a paintbrush with a little bit of acetone is the next step
for solvent.

Yes, you're right. Coils usually don't just come untuned.
However, other components in the circuit will change value
with age, often necessitating an alignment. This is even
more true with tube-type gear, where the heat takes a big
toll on components over the years.

So, I'm "Another Goldenscrewdriver tech", am I?

I am a professional electronic technician with 23 years'
experience with a major aerospace company, and an Extra
Class ham with 26 years in the hobby (a REAL Extra, not
a modern era "gimme" Extra). I've been building, fixing,
and restoring gear for all of those years. Because I'm
restoring a vintage CB radio rather than a piece of ham
gear, you assume that I know nothing and am just dorking
around with it? What are your qualifications? Are you
justified in making such observations about others?

Thanks for all of your insightful "help".

73,
Dean K5DH

Dean,

This is one reason we have problems attracting newcomers. The incessant flames. The fact is once you mention "tubes", folks should realize that the thing may indeed not be well tuned. I'm trying to think if it is the GE Master II ... but it is a VHF rig and the cavities used to grow "crystals" in 'em and detune 'em. One guy showed me a quick way to fix it (yes, you can go in with a q-tip). He picked the radio up and banged it on the bench about 3 or 4 times. Suddenly, it no longer took 4 uV to get a decent signal. It was down to 0.25 uV. I did have to clean my shorts out the first time I saw it, however :)

I was given an old SP-600 which had been under salt water for a brief period of time (I got the radio in 1968). I ended up replacing most of the components in the whole front end as it could barely receive local broadcast stations. It worked fine after I did that, but it was a real mess. Easier to buy a new receiver these days (prices are reasonable and if you figure my time, I was probably making about twenty five cents per hour fixing that slug!). Of course, that was back in the late 60s. Figure a grand buck and a half an hour in today's wages :) It was a good learning experience, however.

I had an IC-28A 2 meter rig do that. It was the squelch control itself
that had gone bad. And it is a real bugger to change due to the place it
is mounted. It can be done though, you will have to contact ICOM to see
if they are still available. I had to replace mine about 5 years ago
after 6 or 8 years of packet service 24/7.
Good luck finding the part.

You didn't mention whether it's a hollow core (hex) or a slotted top. If it's a hollow core, many of those older radios used long slugs. If that's the case, you can usually break them loose without a problem by using a long hex wrench or "diddle stick" to contact as much of the slug as possible. Just make sure you have the correct size wrench (a tight fit). If it's a short or slotted slug, you will probably need a solvent. As far as solvents go, alcohol doesn't usually work, and acetone doesn't penetrate. Try a drop or two of toluene and let it soak in for a while. It will be gummy, and might even be worse than breaking it loose when it's dry, but it won't hurt the coil form. Just remember to measure the slug before you try anything so you can replace it if it breaks.

==========

It's human nature. Anybody who loves repairing,
restoring elderly radio receivers and say's he's never
been tempted to twiddle the slugs in coils and and
slots in trimmer capacitors is telling lies. There's a
good chance that in mass-production line conditions,
receiver alignment, front-end and IF stages were
hurriedly mis-adjusted before leaving the factory.
Experienced maintenance people and knowledgable
amateurs using the correct gear have accumulated ample

evidence of this over many years. There's a lot of satisfaction to be gained from returning something to a better-than-new condition.

I plead guilty to 'illegal' twiddling.

My first offence was committed on grandmother's old Victorian kitchen table in 1941 during the air-raids on Birmingham, England, at the tender age of 16, on a neighbour's 4-valve, 120-volt Excide dry-battery plus 2-volt lead-acid accumulator-operated receiver. The little white-haired old lady offered me 6 pence which she couldn't afford on a widow's pension of 10 shillings and 6 pence a week so I gently refused it.

By 1944 I had advanced to re-aligning secret, 50Kw, 3000 megacycle cavity-magnetron (invented in the same city at the same time as the first offence was committed) air-borne radar equipments.

Of sound character, I respectfully beg for the lenience of this Court.

Reg, G4FGQ

PS: Grandmother's kitchen table is now displayed in the Black Country village museum, Dudley. The first cavity magnetron is now displayed in the Science Museum, Kensington, London, England. But almost identical replicas are hidden inside many millions of microwave ovens in the world's domestic kitchens. There's no trace of the affectionately-remembered 4-valve battery-operated receiver. Thanks to Messrs B and B and a thirst for oil, air raids continue.

My experience has been that the "hex" hole slugs that stick are broken
and the only hope is the pick out the pieces and put in a new one.

Good luck

In an ICOM IC-730 I had a bad meter lamp. I replaced it with an LED.
I sanded the front end flat (and down a bit) so I got more light
dispersal.. Works just fine, and it will never need replacement.

Likely the slugs are sealed with an acetone based paint. Similar to nail polish. Reason: dries fast.

You might want to try some nail polish remover (acetone) to soften it up. I can not offer much encouragement for success, however.

Cheers,

Al Link K4ICL

Givem hell, Dean!

On the coils, I've found that heating the coil form (heat gun is best but solder iron if done carefully) will sometimes melt the wax on the coil form allowing the slug to turn.

If not available, I have on occasion drilled a hole in the PC board bottom of the coil; sometimes getting access for the tool through the other end of the coil will make the difference.

If you do crack the coil, I assume you know its pretty much worthless for reliability and proper tuning after that. Worse case, try to dig up some used coils from other gear and just drill out the old core and install a new one.

Good luck

I have for sale a very nice condition 51J-2 receiver. The front panel is cosmetically about a 9 of 10 and not a repaint. The receiver has the correct band change knob and meter but no top cover. The receiver has the Lankford product detector mod and performs GREAT. Pictures available to interested buyer. $450 plus shipping from 76001.

I have put an old Allen wrench into a stuck slug and heated it with a large soldering iron, then carefully remove the slug by turning the Allen wrench with a pair of pliers while the slug was warm enough to melt the wax.

One other thing, some coils are sealed with "Printer's Ink", a water based ink that chips easily. We used it on all the coils in the PRC-77 radios built by CE.

You have to be careful drilling holes in circuit boards. I have worked on a lot of RF boards with traces run under coils that will be destroyed with a drill bit.

That's a good way of transferring the heat. But care must be taken
not to tork the allen wrench too much. I've broken far too many slugs
with those inflexible steel tools.

Thanks for that reminder. Forgot about some water soluble sealers.

That's a given, that care must be taken where you drill. I've never
damaged a trace yet, though I've opted not to drill some. Of course if
the board has internal traces (sandwich) forget it!!

The last boards I worked on were 16 layer. About the only place you
could drill was through a bad via the connected the top and bottom
layers. At up to $8000 per board, they were rather fussy about extra
holes in new boards.

Looking to monitor my local fire and EMS services. They operate on a EF Johnson Multi-net system. There is no scanner on the market that will track this trunking system. Is there a radio out there that I can set up to "Receive" only. A mobile that I can set up as a base receiver would be nice.

2604. better transmitting on an ICOM T2H Sport

Hello all,

I am inquiring how I would get a better transmit power out of
my little ICOM T2H Sport. I was suggesed using a ground plain antenna
out of a 2 Meter Whip antenna and a cookie sheet. Does anyone else
have a better idea, or if this is the best.. how would I hook it up.
Thank you very much for your anticipated reply.

Eric

Well you can't get more power out, but you can inprove the ERP (Effective
Radiated Power) BY:

1. Get a collapsible after market antenna like the Diamond RH-205 -- URL:
http://www.rfparts.com/diamond/index.html
Can be used as 1/4 wave or 5/8 wave

2. Get a mag mount 1/4 wave or 5/8 wave and put it on a baking sheet

3. MFJ has a rollup Pocket Roll-up 2 Meter J-antenna URL:
http://www.mfjenterprises.com/products.php?prodid=MFJ-1730

4. Build a homebrew 2M antenna -- see URL:
http://ac6v.com/antprojects.htm#2M
Many to choose from:
J-Poles are popular

Good Radiating
Caveat Lector

There used to be a sort of cement you could buy, some kind of urethane I believe, that was mixed up with a very finely powdered high-permeability iron. GC Electronics might still make it, and it used to be sold for emergency field repair of broken ferrite bits.

I've always had good luck by heating the slug with a soldering iron tip,
set on low heat. The "gliptall" will usually melt before the coil form
does, but be careful just the same.

That's the understatement of the week. I've seen lots of new stuff that was factory mis-adjusted, and not just electronics. My new GMC pickup truck tracked a bit to the left until I had a front end alignment done.

Reg, you got my eyes to watering up a bit. How many years has it been since the local store carried 67.5 and 90 volt B batteries? I remember them carrying the things into the 50s and perhaps the very early 60s, but they are long gone now. Back to "tuning" radios; I bought an HTX-404 some years back and the darned thing was of 5 KHz. I returned it for another - and it was also off 5 KHz. At that point I realized that Rat Shack (or their supplier) didn't have properly operating equipment to even set the darned thing on frequency. So .... :)

Hello,

I want to buy a Heathkit SB220 and use it with an Icom 756PROII.
Can someone give me some info to connect a SB220 to an 756PROII (ALC &
PTT).I did look to the website of AB4OJ and found a schematic diagram of
KK5DR.Is this suitible for operation or is there a nicer solution ?Any
overall experience with the amplifier and the rig ?

I have done side by side comparison of a 102" whip tuned by an AH-4 equivalent vs. a resonant style antenna such as the Hustler series. On 40m, There was a repeatable 1 "S"unit difference in rx signal and tx signal strength. I did not have the chance to check it on other bands, but the difference would probably decrease as you got closer to 10m, and increase as you went to 75/80m

Bottom line is that if you want/need performance in a mobile environ, use some sort of resonant antenna, especially on the lower bands. However, a 102" whip will do for convenience. Or you can split the difference and get a screw-driver style antenna.

As a matter of fact, it was measured on 75m. My 11.5' whip with an SGC-230
tuner was 12dB down from my top-loaded junk box antenna. That's two (or more)
S-units. A 9' whip would be even worse. Why spend all that money on a tuner
that dissipates 94% more power than a tuned 75m mobile antenna that costs
less than the tuner?

To be fair, if all anyone wants to cover mobile is 20m-10m,
an 11.5' whip and an SGC-230 did a remarkable job for me.

2624. Battery Pack Amp Hours

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-30 23:07:50 UTC
From: Matthew and Wendy Plante <mapwam@frontiernet.net>
Message-ID: <a7a4b.1378$ll3.205@news01.roc.ny>
Source record: 27247

I am trying to build, or at least cobble together, a battery pack for a receiver. I will only need one (1) amp of power. The battery will have a one (1) amp fuse on both the lead in and out of the radio just for safety. What I have not been able to understand is what amp hours are. I need a twelve (12) volt battery that will last a while, or at least five hours, and be rechargeable. I have been looking at UPS battery pack, or even small car batteries. Any help? Thanks.

Matthew

Well, just a follow up on this. I gave in and went to the local car stereo installer and had them do the job. While I was at it, I had them install a small (3") 12V fan for some extra air flow. I wanted to install the rig in an enclosed area in the console that was just wide enough for the rig, about 10" deep and about 8" high. This "pocket" was all plastic - including the back - however there was nothing behind the pocket under the dash. The installer cut a small hole for the fan and tied it so that if the car is on, so is the fan. It's pretty quiet most of the time as well.

Anyhow, the fan moves about 22cf/m of air into this pocket and out the front right across the heat sink of the radio (the entire bottom of the rig on the Yaesu 8800). It keeps the rig nice and cool even in pretty heavy duty cycles at 20W or so. I haven't run the rig "wide open" for any length of time yet, but I'm willing to bet the rig would still stay pretty cool.

Thanks for all the input. I'm much happier not having wires running around the cabin into the cigar lighter. Now that everything is wired, I have the lighter adapter to use in my wife's car when needed for those short trips.

That might be a bit close, you might want a 1 1/2 amp fuse just to
allow for turn on surges.

>What
>I have not been able to understand is what amp hours are. I need a twelve

One thing you can do is to compute amp hours by saying: I need 3 amps
for 5 hours" That implies you need a 15 amp hour battery at least.

the good news is that a 20 amp hour battery would supply 1 amp for 20
hours...

I'd get a 10 amp hour battery at least, just because... I'd also go
with a gell cell because the will not leak and can be used in any
position. Gell cell chargers are easy enough to come by.

There was an article in 73 magazine about how to charge gell cells
that did a nice job of it.

Amp-hours are the capacity of the battery. A 10 amp-hour battery can
provide 1 amp to a load for 10 hours, 2 amps to a load for 5 hours,
etc. You need at least a 5 amp-hour battery, and more would be
better.

A couple things to remember: At high current draw you get less than
advertised capacity. That 10 amp hour won't give 20 amps for 1/2
hour. The battery will last much less than 1/2 hour at that rate.

Also, lead-acid batteries don't like to be discharged until dead.
That reduces battery lifetime. Some batteries are made to tolerate
this better than others. In any case you want something more than 5
amp-hours.

There's a fellow who did a great lead-acid battery FAQ page. Don't
have the link around, do a search or perhaps someone around here would
have it.

And finally, if the radio draws 1 amp you may want a 1.25 or 1.5 amp
fuse. There could be peak current draw of over 1 amp.

Good luck and 73,
Jim

Gday Dean,
dont get too upset about the "screwdriver expert" jibe - we have to rely on the printed word in front of us and take that at face value. Its been a good subject, thank you for kicking it off, and there has been lots of useful ideas to try, so just accept that. If we were face to face or on air, it wouldnt be a problem but using this particular medium misunderstandings and errors do occur.

And I am sure you will agree that as a working tech you MUST have seen the results of inexpert slug twiddling - sort of like old British motorbikes whose ten previous owners only had a 12" shifting spanner as their major (or only) tool....

to know if there is a group dedicated to the same?
cheers david M0TWA

2636. FA: PRC-77/-25 Accessory Kit, complete

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-31 20:11:22 UTC
From: Mark@the.keyboard
Message-ID: <1kl4lvcr3c50vsn73p281i307kctmi5lfu@4ax.com>
Source record: 27159

I've put up a PRC-25/-77 accessory kit on Ebay,
Item number 2190014211. It includes the tape whip,
tape whip gooseneck, AT-271 long whip, AB-591 long whip
base, H-250 handset, and CW-503 canvas bag. The long
whips and AB-591 bases are not as easy to find as
they once were in the "good ol' daze."

Auction ends 6 Sep.

Hello, I have a Astatic desk mike that I have been able to find ZERO
information on.
It is a desk mike model # D-2
Does anyone know anything about this mike?
What vintage it is?
Possible value of it?
Any information would be of help!
Thanks in advance.

2640. TS-430 carrier question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-08-31 23:23:49 UTC
From: gil <gilpi@mindspring.com>
Message-ID: <9sv4b.12631$Om1.4733@newsread2.news.atl.earthlink.net>
Source record: 27163

On my TS-430, the carrier knob goes from low power up to high before it gets to about 10 o'clock...in other words its a sudden rise from zero to 100 plus watts in just a touch. I know in other rigs there is an adjustment pot inside the rig for low and high which adjusting them would give me a slower rise from low to high power, but Im not familiar with this rig so can anyone with some expertise please give me some advice on this?

Thanks...gil

2645. FS: Glossary of Electronic Properties Handbook, 1965

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-01 07:47:19 UTC
From: John McGowan <emeralddomain@earthlink.net>
Message-ID: <bQC4b.4395$tw6.3596@newsread4.news.pas.earthlink.net>
Source record: 27168
Cross-posted to: rec.radio.amateur.equipment,alt.radio.amateur,alt.marketplace.books,ba.forsale,ba.marketplace

Dating from 1965, was developed by the EPIC group at Hughes under Air Force Contract. Author is Emil Schafer.

A fascinating 86-pp handbook with explanations and equations about all sorts of properties, from dissipation factor in dielectrics to Hall Effect, and includes obscure properties such as Maggi-Righi-Leduc Effect, Galvanomagnetomorphic Effect, and Electroacoustic properties.

A one-of-a-kind for radio guys interested in the real nitty gritty, also valuable to a physics major or researcher, or one who collects vintage handbooks. I'm not asking much, probably enough to cover postage and get it into the hands of someone who can use and enjoy it.

Write me if you're interested. Thanks for your time.

What I did for those stubborn slugs was to heat them with the tip of my
weller. The heat will soften the paint/sealant and not damage the coil
form.

2658. i need another hf rig.....

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-02 20:08:38 UTC
From: "N5XXM, Ken Harris" <k5kdi@cableone.net>
Message-ID: <vl9u77q4nb6kac@corp.supernews.com>
Source record: 27182

i am looking for another hf rig to use at home, dont really matter on the brand for the most part,as long as it works good and looks decent.
I have to trade the following:

Heathkit HM-102 Swr/power meter

Yaesu G-500a Elevation Rotor

Dentron DTR-1200L no tubes, takes 2X 572b's, needs a small amount of work, not much.

Motorola Mitrek 100 watt mobile, crystaled for 145.010, and ready to hook to any tnc.

Realistic HTX-404, needs memory battery, and rebuild of pack, have 2 nicad and one aa pack.

Cobra 139 xlr c.b. base, with matching cobra amplified desk mic.

Hornet, 10 to 40 mtr 100 watt sweep tube 110 volt amp.

Sonar 10 and 12 mtr 100 watt, 110 volt sweep tube amp.

Hammarlung hq-100 tube type receiver

Heathkit dx-100 tube type am transmitter, built in vfo and antenna switchover relay.

Mitac 486 laptop, needs rebuild on battery and display is showing its age, but works fine, and looks ok!

Digital 286 laptop, works good but needs another rebuild on battery pack.

1 older style "bug catcher" type coil, looks rough but has worked just fine for several years.

Lazer brand 500 watt per channel X 2 channel car stereo amp, works great!

One left of the 4cx1000 ceramic tube, eimac, full output!

i have so much stuff i need to get some of it out of my way, and get something in here i will use....

contact me at: k5kdi@cableone.net

August 2003

Dear Amateur Radio Club Members,

As summer fades and we anticipate a return to the rigors of fall, you will be reinvigorating Amateur Radio club operations in your communities. But before you club launches its activities, I hope you can take a moment at your next meeting and consider a disturbing and critical topic - Broadband over Power Lines (BPL).

BPL is a devastating threat to the Amateur Radio spectrum - especially the HF bands. There has been a lot of publicity on this issue - articles on the ARRL website (www.arrl.org/bpl <http://www.arrl.org/bpl>) and other ham radio sites. Your ARRL is at the forefront of the campaign to defeat BPL and will continue to work tirelessly to protect your Amateur Radio bands. And you can help.

This summer individual hams - and clubs - have responded generously to fund ARRL's efforts to fight BPL, and have filed comments to the FCC. But we still need to raise an additional $55,000 to fund the field measurements and document filings necessary to defeat this threat. We're all in this effort together, so I hope your club will jump on the bandwagon and support the campaign financially. We've received club contributions ranging from $50 to $2000. If your organization has already made a donation, thank you.

And if your club is considering a contribution, I hope you'll do so right away. With a contribution of $100, $250, $500 or more, your club can join the roster of clubs that are joining the effort. Your commitment will make a tremendous difference. And we'll put a list of contributing clubs on the ARRL website this fall as our way of saying thank you.

If you need more information on BPL for your club, go to the ARRL website (www.arrl.org/BPL <http://www.arrl.org/BPL>) for the full story, including copies of the two FCC filings and a video that graphically demonstrates the interference radio amateurs would experience from BPL. The video can be downloaded and played at your next club meeting, and there's a PowerPoint presentation you can use. Just follow the link above to an "Understanding the NOI" page and a resource page where you'll find the presentation.

ARRL President Jim Haynie calls BPL the biggest threat to Amateur Radio in decades - and hams have lent their voices to the cause. If BPL becomes a reality, many Amateur Radio activities, like Field Day, will be meaningless. Your club's support with a generous financial contribution now will help fund this effort.

Thank you for considering this request. Contributions can be made on-line at www.arrl.org <http://www.arrl.org>, or by mail to BPL Special Spectrum Defense Campaign, ARRL, 225 Main Street, Newington CT 06111.

73,
Mary M. Hobart, K1MMH
Chief Development Officer

For mobile use, I wouldn't use either handheld. Too little power; too
little selectivity for California's repeater madhouse; and controls
are too dinky for driving. For the same price as the t7h, look at the
Icom V8000. 75 Watts, over 200 memories, big knobs.

For an antenna, be wary of glass mounts -- especially if you have any
film on your window. A quarter wave whip on a mag mount, or a lip
mount, won't put a hole in your car, and will get out better.

Gonset Communicator III - 2 meters. .....$100 plus shipping
This is a separate receiver and and crystal controlled transmitter which I believe is from the late 1950's or early 1960's. I fired up this radio and heard my signal generator and a few slope detected FM signals on 2 meters after hooking up an antenna. I do not have any 8 MHz crystals for 2 meters so I was unable to test the transmitter. The radio appears to be complete. It does have a number of scratches. I don't have a manual but they are available from a number of sources on the Internet.

I have a Yaesu FT-847 for sale. The rig is in as new condition and I have the original box and manual. In addition, I have replaced the stock SSB filter with an Inrad 2.1 SSB filter. The package also includes the following items:
- LDG AT-11MP Autotuner (as new)
- Buxcomm digital interface (HF and VHF cables)
- Yaesu FP-1023 power supply (as new)

I can only sell the complete package at this time and the price is $1450.00 firm.

Source record: 27192

Regardless of whether we are talking about using an HT for
mobile use or not, I own both rigs mentioned.

I like them both but if I only had to have one it would be the
w32A. Regardless of the specs the W32A has a bit more
wattage and a lot more sensitivity and adjacent frequency
rejection. The benefits of having a rig with dual receivers
like the W32A are great when you want to hit a satellite or
listen to specific frequencies in one band while monitoring
one in another. The scan functions are great. I usually carry
the T7H with me and use the W32A only when I am sure
I won't expose it to something that may damage it, I treat it
with kid gloves.

An original BC-312 Manual.....$35 shipped in USA

This War Department technical manual covers the BC-312, BC-342, BC-314
and BC-344 receivers. This manual is dated March 1944. The cover has
light staining. The inside pages are clean and I found no markings on
any of the pages.

I have Yaesu 1500 and 2500. Put 1500 in mobile where it has become royal PITA. Programming on the fly is a pain!

I'd put it on my Honda M/C if it were easier to program w/o the manual in the hand.

Have 2500 in house because its volume is about 180% of 1500. Ease of programming makes it my Number ONE rig.

Looking to trade the 1500 for another 2500 for Honda M/C & J-3 aero mobiling.

Thanks for the info Fred!

Is that the TK-10420 IC? A 16 pin chip. The IC-448 uses one of those,
a narrow band FM IF chip, that also includes a squelch function. I
have gotten a circuit diagram and have found some odd voltages around
the IC, but I am still not sure if it is the IC, or any other component,
capacitor etc., that has gone bad. Have to do some more testing,
reflow some solder etc...

I just looked through the HRO catalog and don't see ANY mobiles
meeting that criteria. Looks like you would have to settle for a
dual-bander.

Just buy one radio, once. A 706MKIIG. RMK comes with it.

2690. Kenwood TM-2550A trouble

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-04 17:58:20 UTC
From: c_adra@hotmail.com
Message-ID: <fd55b2c5.0309040958.31045d72@posting.google.com>
Source record: 27113

I have a trouble with my old TM-2550A.
When I turn it on, the unit does not show the display, only the red TX light turn on without pressing any button, even PTT.
I tried to reset the CPU shorting the two pins located on the lower board. Also, I measured the CPU battery backup, showing 3,2 V aprox. (after 15 years?).
Then, I test the pwr and has no output (0 W).
Any ideas, and an schematic diagram would be well appreciated.

2691. Antenna for Yaesu FT-2800M radio?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-04 18:14:14 UTC
From: RalphDL@webtv.net
Message-ID: <13366-3F5780F6-228@storefull-2272.public.lawson.webtv.net>
Source record: 27116

I installed a Yaesu FT-2800M radio in my 1997 Jeep TJ Wrangler with a soft top, and use a magnetic mount antenna, which is tough to locate and keep on the body.

Can anyone recommend a permaently fixed antenna for this vehicle radio combination? Where would it be mounted?

Thanks in advance.

RalphDL@webtv.net

2692. Yaesu FT-736 no SSB modes, no CW mode

Source record: 27114

Hello friends.
My Yaesu FT-736 shows a curious problem. When I switch to USB, LSB, CW or CW-N it silences and no audio output is heard. The S-METER shows no signal at all. It seems to be a digital trouble, or hardware "squelched" . It works great in FM & FM-N modes.
Any ideas would be appreciated.

If you're willing to accept a 2-meter/440 dualbander as qualifying,
then the Kenwood TM-G707 has a detachable head, and a remote-mount kit
is available for it. I've had one for over a year and find it to be a
very serviceable little mobile rig.

I already have a better radio - an FT-100D, in the car, but I'll be switching cars soon and need something with a smaller head, and I really don't NEED all the features of the FT-100D in the car. That's why I just want an FM mobile. The TM-G707A, which I've owned in the past, in a good one with a compact head, so I may have to settle for that, although I rarely use 70cm.

2695. FT857 mobile 80m tuner?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-04 19:02:25 UTC
From: markt@kram.org
Message-ID: <1rek21-p88.ln1@kram.org>
Source record: 27118

I have an FT857 in the car and mainly use it with an ATAS120 on the trunk lid. I'm very happy with that combination and find the one-button tuning such an advantage that I don't mind the slightly lower performance of the ATAS120 compared with a hamstick on 20m for example. I also have a 20m hamstick that I sometimes use when I want that bit more performance. The 20m hamstick is wide enough to cover the whole band within the FT857's acceptable SWR limits so I don't need a tuner to use it.

My problem/question is.... what tuner should I use with the FT857 to "widen" the bandwidth of 40m and 80m hamsticks so that I can tune them middle of the band(s) once by hand then let a tuner sort out the SWR for using them across the whole band(s)? I don't need the tuner to work miracles and make a whip cover multiple bands. I do want the tuner to work with as little manual intervention as possible so that I can press a button and know that it will work, like with the ATAS120, and keep my eyes on the road. The button (if any) needs to be on the radio/mic as the tuner will be in the trunk so out of reach.

I've tried an LDG RT-11 but don't think that will work for me long term as the FT857 throttles back the power so much when it sees high SWR that the RT-11 can't tune. The RT-11 can tune my 20m hamstick from 20m up to 10m and in-between but can't tune an 80m hamstick across 80m.

I need to use about 2 feet of coax from the tuner to the base of the whip as I'm limited in how I can get the cable from inside to outside.

Currently considering a) the FC-20 because it is Yaesu so should be able tune without high SWR throttling the power back and causing problems as it does with the RT-11 and b) the SGC-239 because I've read on the SGC website that it works fine with recent Yaesu radios. I understand that with either of these I'll need to wire the coax to the wire output terminals and I am slightly concerned that might be too much of a bodge and hurt performance.

Any ideas or comments would be welcome please. Has anyone else solved the same problem, and if so how did you do it?

Thanks,

Mark.

>The TM-G707A, which I've owned in the past, in a good one with a compact head,
>so I may have to settle for that, although I rarely use 70cm.

That's similar to the sort of issue I have with using a combined
HF/VHF mobile in my van. It'd be nice in many ways to have all of the
bands in one radio, but the heads on the allbanders are both bigger,
and a lot more complex than on the VHF or VHF/UHF radios.

I considered replacing my TM-G707A with something like an FT-857, but
decided against it partly for this reason. On the TM-G707A I can
switch transmitter powers at the push of a button (and have a choice
of three power levels to use), while the FT-857 requires diving into a
submenu to adjust the power. Similar issues exist elsewhere in the
user interface.

Different follow up:

I just did a RT from Boston-Logan to Chicago-O'Hare. Both ways I had
my HT in carry on, antenna removed, put it in the tray with all the
other battery-powered devices, and ran it through the X-ray conveyor.

No comment from the TSA people.

I did however, have it charged and preset to a NOAA weather frequency
in case there was a need to demo it to them as a working radio.

But the skill is in where and how hard to hit it ;-)

Worked with a piece of production equipment I dealt with, with a relay
which stuck occasionally, no matter how many times it was replaced
(Note: never buy serial # 0001 of anything).

It was far simpler to kick it in just the right spot.

NO, the squelch control that goes bad is the actual mechanical pot, a
little bitty one with, thankfully a small wire harness attached that
solders into the front board. That is in the front of the rig, once you
take the face plate off you will see it. The wiper inside goes open and
that causes the squelch to not work any more. That is what happened on
this end any way. That by the way is only the second problem that I have
had with that rig. The other problem was the audio chip went bad and it
was easy to replace.

Hello,

I think any kind of trunklid mount would do the job fine if you don't want to put holes in your car.

Avoid Diamond brand because the shape of the SO239 connector's screw is not compatible with most PL259 or make the test with your antenna!

John, check out www.kendoo.com .. I found them to have the best prices
and usually carry both Nicad
and NiMh.. Just be careful if you're using a rapid charger, as it most
likely won't work with the NiMh
battery, but should be fine with the Nicads..

Good luck in your search, Pete

If I had a trunk on my Jeep, that might work. I'm using an RS 19-210 mag mount on the left front fender. It works real good with an IC-2100H. Firestik makes an antenna mount for a Jeep that fits under the hood. Requires drilling two small holes.

http://www.firestik.com/Catalog/MK-J4R.htm

2726. Price Reduction FT-847 Package

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-05 16:25:08 UTC
From: John Schneider <thecop@optonline.net>
Message-ID: <EN26b.33244$Ay2.6476910@news4.srv.hcvlny.cv.net>
Source record: 27049

I have a Yaesu FT-847 for sale. The rig is in as new condition and I have the original power cord, hand mic., box and manual. In addition, I have replaced the stock SSB filter with an Inrad 2.1 SSB filter (although the stock filter will be shipped to the purchaser as well). The package also includes the following items:

- LDG AT-11MP Autotuner (as new)
- Yaesu FP-1023 power supply (as new)

I can only sell the complete package at this time and I am asking $1300.00 (facilitate purchase of a new radio).

The charger does not put out enough current for transmit, so it tries,
runs out of power, tries, runs out of power. An actual DC supply that
puts out continuous 2 amps or so would do it, although might overwork
the charger circuit.

Plenty of power to monitor and receive all day.

New battery time.

My former high school orchestra teacher owns a W32A, and I got the T7H. He likes the dual monitor,
but doesn't know much more than what he has to about ham radio. The tech stuff he leaves up to his
brother-in-law who I think is in the 2-way business, pro and amateur.

I like the smaller size on the T7H, but you gotta case it or leave a protective film on the display
or it will get scratched just like mine did. I suppose the same thing could happen with the W32A,
tho.

Planning to get a NiteIze radio holster once I can find a local retailer that stocks them.

John

Message-ID: <vlj1usj8h1ne11@corp.supernews.com>
Source record: 27060

OK, I've put my Pixie II together and I see where there's a simple mod to go to 40 meters instead of 80 meters by switching the crystal and one inductor. Does anyone know if this mod could be carried a little farther and take this little gem up to 20 meters??

Any help is greatly appreciated. 80 meters is OK but, here in Alaska, you can't reach very many people..

Thanks,

Paul Jordan

Source record: 27067

Hi All;
I have for sale:
This real nice Condition "VARIAC" is the real thing, made by General Radio, it is thier Model W10 & good for 10amps @110vac.
Originally intended for mounting on a Power supply panel, it can also be installed in a small cabinet for portable use like in powering up old radios that have not been used in years.
The Dial is reversable with printing on both sides and you can wire it so that it increases voltage in either direction, nice!
I have tested it by applying AC voltage to the connections shown in the pictures and found it to work real nice and was able to adjust the line voltage from zero to 165vac.
Hook-up is eal easy:
Input line voltage connects to 1 & 5, the adjustable output voltage is at #2 & either #3 or #4 depending on which direction you want the dial to show!
I always use a Variac to power up the older radios, most used item I have :-)
I hope someone can use it?
Pics>>
http://www.myradioroom.com/variac1.jpg
http://www.myradioroom.com/variac2.jpg
http://www.myradioroom.com/variac3.jpg
Price is $50 + UPS

I have for sale a very nice condition 51J-2 receiver.
The front panel is cosmetically about a 9 of 10 and not a repaint.
The receiver has the correct band change knob and meter but no top cover.
The receiver has the Lankford product detector mod and performs GREAT.
Pictures available to interested buyer. $400 plus shipping from 76001

2746. Review: Ramsey HFRC-1 WWV receiver kit

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-06 19:52:44 UTC
From: shoppa@trailing-edge.com
Message-ID: <bec993c8.0309061152.284f3c@posting.google.com>
Source record: 27069
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

OK, it's not truly homebrew, but I bought a Ramsey HFRC-1 WWV receiver kit last week and put it together last night.

A little background: when I was in junior high I put a couple of Heathkits together. That's my total experience with commercial kits, and the experience is several decades old. Since then
I've done a lot of homebrewing, and I've bought-repaired-sold several used Heathkit rigs, but until this little radio, no more
kit building. By necessity I compare the Ramsey kit with Heathkit standards in a few places below.

It's a very basic 10 MHz superhet receiver in a smallish package. It has a built-in speaker (more on it below), power from battery or 12V adapater, and an antenna input and external speaker output. There's no tuning involved; it's a fixed-frequency receiver, and the only front panel controls are power on/off and volume.

The kit itself is $40, I added on a $15 case and paid another $7 or so in shipping. It arrived two days after I placed the order over the web.

PC board assembly was a breeze. The PC board was nicely laid out, the solder mask is excellent, and the instructions were straightforward and not too much different than a classic Heathkit. It took about an hour to stuff and solder the board.

Putting the PC board into the case was a slightly more difficult matter. The supplied speaker, if you put it on the PC board where there is space available for it, blocks the screws needed to assemble the little plastic case. Some RTV convinced the speaker to live elsewhere (glued to the top of the case). A Heathkit never would've been like that!

Similarly, with a Heathkit receiver they probably would've given me the plugs needed to run the radio. Instead a newbie without a junk box assembling this kit will have to run to Radio Shack to get the plugs for antenna and external speaker. Oh, well, Heathkit is no more, and my junk box had what was needed.

The receiver itself works great. I plugged a random longwire and ground into the little battery-powered receiver and instantly got ticks from WWV. There's a test point (or you can do it by ear) for tweaking two variable inductor transformers that do input matching and image rejection - those are the only RF adjustments that can be made.

So, while Ramsey clearly doesn't live up to the good old Heathkit standards in every way, it does come pretty close. The receiver was clearly designed with kit-building in mind, and it does work nicely.

Maybe I'll try one of Ramsey's QRP rigs next.

Does anybody know of a 5 or 6 KHz wide AM filter
for the Icom 706mkiig rig? The standard 8 KHz
filter is way too wide. Somebody once suggested
using a filter from another Icom rig and plugging
it in to one of the unused optional filter slots
in the 706. Has anybody done this, and if so does
it work?

Take a spin in the initial set mode filter menu and see if there is a
selection for an AM filter. I don't remember one being available. If
none are available the 706MKIIG will not know to select that path when
in AM mode. so that would mean changing out the soldered in filter to
one of a narrower bandwidth.

Try Ten-Tec kits. (I don't think they get nearly enough press)

I built their 20m QRP kit a few years back. Nice unit. And very
reminiscent of Heathkit - in some ways even *better*. You build a chunk
of the circuit, then test it - so if you make a mistake, you don't have
to pull out layers of parts to fix it.

My Kenwood TS440S is beginning to present symptoms (frequency drift and intermittent dots in the display) of PLL unlock. Service Bulletins at Kenwood.net suggest that replacing a fist full of diodes with new diodes of any of these types : 1S2588,1SS91S, BA282 will cure the problem. Additionally, I have heard that 1S1587 diodes can be used. However, I have been unable to find a source for these parts that will send or sell me just a fist full. I haven't tracked down the manufactures of all the parts. However, the BA282 seem to be made by Vishay.

Can any of you recommend a supplier for any of these parts? Thanks

You'd have to pick a filter that uses the same IF frequency. Different
Icom rigs use different frequencies.

What about listening to AM broadcasts using LSB or USB mode?

Frequency drift is probably not the diodes. There have been problems
with one of the voltage controlled oscillators. The only problem I
know of with the diodes is when one band goes bad.

I sent my TS-440s in for repair and they replaced a few components
(not diodes) and it has been OK for a few years now.

As far as I know the drift problem is common and NOT diodes but is due
to the 'cement' that is pored over the VCO components. After time
this 'cement' causes prblems and needs cleaning off and a more recent
anti-vibration cement used. It can also cause deterioration of some
capacitors. Beware that picking out the adhesove cement is tedious
and may cause breakage of the odd component lead. Mine was done some
time back and is now perfect.

Hi Tom,

I have a TS-940 that had the same problem (freq.drift, blank display).
Was a problem on the PLL board. If I tapped/slapped the top of the transceiver or tap the PLL board, it would also cause the rig to jump off freq., warble or make the display go blank. It was caused by several broken solder joints on the bottom side of the PLL board. Using a magnifying glass I found "rings" around the component leads on the solder joints which were solder fractures. This has happended twice on my rig, both on very hot days. Now I avoid operating the rig when it gets hot in the shack (90-100 degrees) and have not had the problem since. Have owned the 940 for 13yrs now.
You may want to inspect the solder joints on that board with a magnifying glass before replacing parts.

Good luck on fixing your rig
Tom

There is a well-known problem with the VCO circuit. They applied a
coating during production which was supposed to protect the circuitry
from moisture. In fact, the coating was hygroscopic, and over time it
creates more problems than it cures.

The solution was to scrape all this gum out, replace the doides, then
apply a coating of hot-melt glue over the area to seal it. Kenwood
used to do this under warranty for all TS-440's, regardless of whether
the owner was the original purchaser or not. Don't know if they still
do.

Thanks, I'm aware of the "goop" issue as well.... I'm just trying to get prepared for all contingencies. Are you saying Kenwood used to repair this for free even if your warranty has expired?

This is a USED 20 meter three element full size monoband 20 meter beam:

Boom Length - 16.5 feet
Longest Element - 37 feet
Weight - 35 pounds
Wind Surface - 5.4 square feet
Turning Radius - 20 feet
Gain - 8.5 dB
FTB - 29-25 dB

The bean was installed on a tower for several years. I took it down to install a tri-bander.

It was carefully taken down with a bucket truck, disassembled and packaged in the original box; with all the hardware necessary to reassemble the beam. It is in excellent physical and electrical condition. The original assembly manual is included. However, the elements are tarnished (i.e. not shiny) due to exposure to the weather.

The box is 7 feet long by 6 inches by 5 inches and weighs about 45 pounds.

$175.00 plus shipping from 08809.

Is this problem throughout the TS-xxx line or just specific models.
Specifically, does the TS450S/AT sufer from it as well? My display
has taken to not coming on until 5-10 seconds after power up. Perhaps
that's the solder joint problem someone else mentioned in this thread?

you might be better of using a modern SMD dual schottky diode, better match, lower capacitance etc. You will have to devise some neat way of fitting them in. Circuit is in series config so try HSMS-2814, or 2 in one package HSMS-2815. Try Farnell or Newark? for these parts.Yes the service manual says you need a matched pair of
1902-0385. I suspect a pair of 5082-2835 would do OK also.

as many posters have pointed.
2 problems - the goo & dry joints.
the goo can be removed carefully with tweezers etc, the dry joint can easily be found by using freezer spray or lighter gas.
the joint will show the ring quite nicely & it makes it easier to see with a bright light (goes dull)

not only the 440, some 430's & the 930's suffer the same.

i have known the VCO varicap diode to be trouble some aswell.

mike

you WILL get a better answer on the ts440 email reflector that you are
subscribed to.

if i remember rightly...
if the dots is on only a few bands then try tuning vfo-1 a bit
if its dots on all bands then try vfo-5
and pick some of the ''glue'' away from the components as its supposed
to attract moisture.

2775. For Sale: Various Items

Here are a bunch of items for sale. Prices do not include shipping. I
will ship overseas.

Sprague TO-4 Capacitor Testerï¿½ï¿½ï¿½..$160 plus shipping
This unit is in excellent condition and works great. The front panel
still shines like a new unit. Includes a copy of the manual
http://members.cox.net/radiostuff9/sprague_to4.jpg
http://members.cox.net/radiostuff9/sprague_to42.jpg

ZM-3A/U Capacitance Analyzer.....$140 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have
a manual , however they are available from several sources on the
internet.
http://members.cox.net/radiostuff9/zm32.jpg

JAN 7293 4CX250 plus socket and Eimac SK-606 Chimneyï¿½ï¿½..$50 per set plus
shipping
Tubes and chimneys appear to be NOS. Sockets are used. I have four sets
of these
http://members.cox.net/radiostuff9/4cx250.jpg
http://members.cox.net/radiostuff9/4cx2502.jpg
http://members.cox.net/radiostuff9/4cx2503.jpg

Eimac 4-125 plus Socketï¿½ï¿½ï¿½ï¿½..$75 plus shipping
Tube appears new. The brown color in the glass is a reflection off of
the beige background. Socket is used.
http://members.cox.net/radiostuff9/4-125.jpg
http://members.cox.net/radiostuff9/4-1252.jpg

Eimac 450TH/VT-108 Transmitting Tube - $75 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

National MCN Dial ? New in the Boxï¿½ï¿½..$50 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Steering Wheel Vintage Transmitter Knobs.....$35 plus shipping
Three Bakelite 1930's steering wheel style tuning knobs with metal
pointers. These are 3.25 inches in
diameter. These would would be a great addition if you are home brewing
a 1930's or 1940's style transmitter.
http://members.cox.net/radiostuff9/steeringknobs.jpg
http://members.cox.net/radiostuff9/steeringknobs2.jpg

79 Crystals ? various holdersï¿½..$2 each plus shipping or $75 for the whole lot plus shipping
FT-243,CR-1A etc. The frequencies are between 6 to 8.5MHz. I saw a few 40 meter 7080 kHz crystals. These are untested.
http://members.cox.net/radiostuff9/crystal_lot.jpg
http://members.cox.net/radiostuff9/crystal_lot2.jpg
http://members.cox.net/radiostuff9/crystal_lot3.jpg
http://members.cox.net/radiostuff9/crystal_lot4.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½$15 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover on one is broken but the unit is OK
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

Gonset Communicator III - 2 Meters.....$90 plus shipping
This is a separate receiver and and crystal controlled transmitter which I believe is from the late 1950's or early 1960's. I fired up this radio and heard my signal generator and a few slope detected FM signals on 2 meters after hooking up an antenna. I do not have any crystals for 2 meters so I was unable to test the transmitter. The radio appears to be complete. It does have a number of scratches. I don't have a manual but they are available from a number of sources on the Internet.
http://members.cox.net/radiostuff9/gonset_com3.jpg
http://members.cox.net/radiostuff9/gonset_com32.jpg
http://members.cox.net/radiostuff9/gonset_com33.jpg

Heathkit Electronic Switch Model S-2 with original manual....$20 plus shipping
http://members.cox.net/radiostuff9/heath_switch.jpg

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$35 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

good condition externally with a small tear in the cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

RCA Capacitance Testerï¿½ï¿½..$35 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with a mirror.
Works OK.
http://members.cox.net/radiostuff9/rca_captester.jpg

Barker and Williamson Coil Mounting Barï¿½ï¿½..$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Triplett VTVMï¿½ï¿½ï¿½..$40 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

>(after 15 years?).

I have the TM-2530A, lower wattage of the same radio. Had the same
problem with mine - it turned out to be the connectors between the
'head' (front panel) and the main board. With the CPU facing up, the
wires are on the far right side of the board. Clean the connections
and pins, you should be fine.

I'm building the ten-tec 1320 qrp kit right now. One nice thing, if
you can't get it to going (and I couldn't make the vfo work), you can
always send it to ten-tec. They fixed the vfo, and now I'm finishing
up the kit.

Duh. I mentioned that...

So it's a dual-bander. Big deal. It seems to me that the more important issue is the remote head rather than single-band, and if that's the case he's almost certainly into dual-bander territory. The 8100 is a fantastic radio, one of the few that can do cross-band repeat, and it's small too.

The other area where "goop" is causing a problem is
in mechanical filters from the late 60's. The foam
cushioning inside degrades and hardens and provides
an energy conduction path around the outside of the
filter.

Ah, I see, that one works perfectly here.

I think I have solved the problem. It was not a component problem.
Under one of the PC-boards they had soldered a grounding lug. To
prevent this from shorting things on the PC-board they had glued
a small piece of plastic on the PC-board. This glue had turned into
a brown, rather brittle, substance, covering part of the squelch circuitry,
and also the input to the IF-amplifier. After removing this I found out
two things. The voltage at the input to the TK-10420 IF-chip raised
from 1.5V to 2V (which is the voltage supposed to be there), the output
from the chip rose from 2 to 3V (supposed to be 3.5V), and the S-meter
started to show signal strength again, something it have not done
for years... The squelch also started function again!

Using the test leads on my multi-meter I could measure a resistance
of 1-5 Mohm on this substance.

Old glue seem to be a bad thing to have on PC-boards :-)

Jim,

The 450 and 850 do NOT use this compund. You have nothing to worry about there, but you might want to check to make sure your memory backup battery has not corroded. They will leak onto the control board and make nasty gremlins appear. The 450 and 850 have been one of K'woods most successful models. Hopefully the same can be siad for my new TS570SG!!

The reason I asked about a 2m with a remote head is because I rarely use 70cm.
I am well aware that almost every dualband has a remote head. I am not sure why
2m radios aren't made this way. In any case, if I am going to get a dualbander,
it's going to be a Kenwood TM-G707A.

That's correct. The repair was paid under warranty by Kenwood (if
done by a Kenwood warranty service station) regardless of when the rig
was purchased or who the current owner was.

When did you have this work done and by who?

To my knowledge Kenwood has never paid a warranty station to do the work.
They may have done some in-house.

2794. "Remote Base" operation with Icom IC-2720H

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-08 17:54:23 UTC
From: spamsink@scoot.netis.com
Message-ID: <1bgplvocvtvfmtm3cdb42bhl91vr9be4cb@4ax.com>
Source record: 27017

I was told that one can set up the Icom IC-2720H as a sort of a "remote base" or cross-band repeater, so that I can use my 440-MHz HT to talk to the IC-2720H and have my transmission repeated on 2 meters, with the received signal on 2 meters repeated back to me on 440.

Is this possible? If so, how?

I looked on the Icom website and even downloaded a PDF of the user's manual for the IC-2720H and couldn't find any indication that this could be done.

If you can't do that with the IC-2720H, is there another dual band radio with which you can do that?

Thanks...

Rick WA1RKT

Cross Band Repeat Function

The ICOM IC-2720H supports cross-band repeat and
this feature may be activated by simple key strokes as follows:

To invoke this function:
Set the frequencies
Press LOW and DUP, then press SET for two seconds
Two flashing Ls will appear on the display

To exit this function:
press SET for two seconds

Important ! the VHF Freq must be programmed on the LEFT side, the UHF
Freq on the Right

Also - make sure you press LOW and DUP at the same time.
This can be difficult -- if you don't and get the 'busy' light blinking -
you have put one channel into 'monitor' mode and it won't repeat despite
the blinking 'L's
Just clear it (press SET) and try again.

P.S. It's not listed in the user's manual because the non-US export
models require internal mods to x-band. The info in my last post was from:
http://www.w4rp.com/ic2720/xband.htm
and also from here:
http://www.universal-radio.com/catalog/fm_txvrs/0272cross.html

Fair enough. Though I have the 8100, I too don't use 70cm at all, and
wonder why they don't make a single-band radio with a remote head.

I would actually consider a Motorola radio with the remote head, if I could also get the programmer and software at a reasonable rate, but with those added costs, it's more economical just to buy the dualbander, which also has the added plus of being field programable and if you get something like I've considered (Kenwood TM-G707A), you'd get a much more compact head.

If you're wanting a small control head, but feel you must settle for a dual bander, you might look at the Yaesu FT-90. Its so small it is actually smaller than some radios' control heads.

I have for sale a very nice condition 51J-2 receiver.
The front panel is cosmetically about a 9 of 10 and not a repaint.
The receiver has the correct band change knob and meter but no top cover.
The receiver has the Lankford product detector mod and performs GREAT.
Pictures available to interested buyer. $400.

Might check and see which dual-banders allow you to select the band for each "side". My Alinco DR-610 can do VHF/VHF, VHF/UHF, or UHF/UHF. The new DR-620 can do this, also. I believe the Icom IC-2720 will, also. This way, you'll get the advantages of TWO VHF radios in one.

Others have told me that radios like one of the Alinco HTs can also do
this.

Does anyone know if you can do this with the Kenwood TH-F6A? There's
nothing I can find in the manual about it but there may be some kind
of undocumented procedure as with the IC-2720H.

That radio (TH-F6A) would be a good companion HT for a crossband repeat (CBR) capable rig, but is not in itself a crossband repeater. That is, it can work crossband split (TX on one band, RX on another) where one one function is done at a time, but it can't receive on one band while simultaneously transmitting on the other.

Typical example: You're on a SAR mission in a valley. You can hear the 2-M repeater fine, but can't reach it with your HT. If you had a CBR capable rig in your car (like the IC-2720H or TM-V7A), you could set it to receive on UHF simplex and simultaneously transmit on the 2-M repeater's input frequency.

You set the HT to listen on the 2-M repeater frequency, but have it set to transmit on UHF when you key up. When you key the HT it's now talking to your mobile CBR and the CBR is hitting the 2-M repeater on it's input frequency with 50 watts. When you unkey, the CBR stops transmitting (no input on its UHF side) and your HT is hearing the repeater.

This is one simple example. There are more cpmplex setups, but then we have to start talking about ID requirements!!!

Icom has a "must read" document on crossbanding at:
http://www.icomamerica.com/support/documents/crossband_repeat_info.pdf
It's an old reprint from QST, but lots of good data that still applies.

2810. For Sale: VPC SDR-1000 Satellite Data Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-09 18:08:39 UTC
From: yawnyawn123@hotmail.com
Message-ID: <e11cdb0b.0309091008.59544252@posting.google.com>
Source record: 27033

For Sale: Satellite Data Receiver as above. Useful for adjusting / peaking a satellite dish (it has a switchable audible signal strength indicator). Useful also, of course, for receiving data from a satellite to an RS232 interface (presented on RJ45 connector at the rear of the unit).

The unit is used and fully functioning. Manufacturer's full spec is at http://www.vpcvalley.com/html/products2.shtml

Located in United Kingdom, will ship worldwide. Price GBP50 + shipping.

If you're interested please email me at yawnyawn123@hotmail.com

There is a group called Handi-Hams which is a resource for all sorts
of info on adaptive technology for hams.

Don't have a URL, but a little Google or a look at ARRL might bring it
up quickly.

As rigs get more computerized, this sort of thing should get easier,
at least in theory.

Happy trails,

Ah, wouldn't you know it...

There is apparently an Alinco HT that costs half the price of the
TH-F6A that does CBR just fine, so says a local ham here in NH who
owns one.

Ditto the Icom IC-W32, which another owner here tells me can do CBR
... for about 2/3 the price of the TH-F6A.

But nooooo .... I had to have 220 along with 2M and 440, so I bought
the TH-F6A. :-(

Oh, well... (it's a nice HT otherwise...)

Just my opinion, but anyone who uses a walkie-talkie for a crossband repeater is asking for a repair bill. None of the talkies have enough heatsink to support much over a 20% duty cycle and repeater service would be 100%. Think about it if you are not talking then the repaeter is and the talkie doesn't get a break.

Maybe that's why the Kenwood won't do it!

There are three power selections for the TH-F6A. If you select the
lower two, you can transmit pretty much continuously. If the HT is up
high enough, the height will compensate nicely for the low power.

But, I wasn't planning to use an HT for this; since I have the TH-F6A
anyway, I was hoping I could just use it for some feaibility
experiments,

Yes it is. I especially like to be able to monitor 75M and 40M local
SSB activity. Try doing that on those other HTs.

Hi, Are you talking about a IC-4AT or an IC-04AT?
If your talking about a 4AT, it's pretty easy.
I had one of those a while back.
Great radio, can't kill them!!
Tuning? Just use the thumbwheel on top to set the frequency.
If I remember correctly the transmit offset is on the back, plus, minus or simplex.

2821. SSB bandwidth filters?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-10 13:18:26 UTC
From: Bob Cook <captcook@compuserve.com>
Message-ID: <bjn8balpp1@ngspool-d02.news.aol.com>
Source record: 27044

I have just bought a new Icom 706 mk II G. I believe the standard ssb bandwidth filter is 2.4 khz.

Icom offers two optional ssb filters, (2.8 khz and 1.9 khz).

I'm curious what the consensus is re the advisability of changing to the 1.9 khz filter.

Or perhaps there is a artical or reference discussing the question.

Thanks,

Bob K9KKY

shoot, I don't know, AM and RTTY/packet filters, perhaps? 1.9 is going
to slice the audio just enough that some folks are going to be difficult
to understand, but might have a little effect in clearing out the
crosstalk. 2.8 just the opposite.

I have both narrow SSB filters in my 775. I don't use them much. I
think you can do quite well with the passband tuning and the SSB filters
that comes standard in the 775, but if you have some money you want to
spend then go for it.

775 is a great radio, stock.

Source record: 26955

<< Does anybody know of a 5 or 6 KHz wide AM filter
for the Icom 706mkiig rig? >>

Leland-

There is an FL-102, 6 KHz 9 MHz IF AM filter listed in an old catalog for the IC-775DSP. AES has it still listed, but as discontinued. Since this radio uses some of the same 9 MHz filters, it might be possible the FL-102 would be compatible with the IC-706 if a) you can find a place to put it, and b) you can find a way to select it while in AM mode.

I have the original IC-706 with a narrow sideband filter installed. When in AM mode, it is possible to select a "NAR" filter, but I'm not sure if it is choosing the stock SSB filter, or the optional narrow SSB filter. I suspect it is using the stock filter, but haven't done a test to find out.

I suppose the easiest case would be if the FL-102 fits in place of your original AM filter.

2832. Re: ICOM IC-T7H or IC-W32?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-11 01:00:06 UTC
From: Stix <pipestixNOSPAM@hotmail.com>
Message-ID: <jMP7b.33986$S_.24670@fed1read01>
Source record: 26956

Thank you to everyone for your continued responses. I'm logging them all to make my final decision.

Allow me to add a few more details to the aforementioned info...

Although my first thought was a mag mount antenna, I have a '94 Jeep Wrangler with a fiberglass hardtop. Because of that, it was suggested to me to get a glass mount for the front window (as the other windows would be removed by removing the hardtop). I do have a metal lockbox in the back that a mag could mount to, but then the antenna would be inside and I understand that's not ideal.

The reason I'm currently looking into a HT is simply finances. While some day, I hope to have a base station in every room, a mobile in every vehicle, and a HT for every occasion, I can only afford one radio at this time (and I have to save for awhile for that!). I'm looking at a HT because of versatility: I can use it in my home, in my vehicle, or walking down the road. I'm hoping to extend it's range with the additional antenna and use a speaker/mic or some sort of headset to facilitate mobile use.

Any further thoughts/ideas/suggestions based on this additional info? I'm open to any and all comments.

Thank you again for all your help.

Struggling to get back on the air...

I have the task of purchasing a 2-mter/440 radio, power supply, antenna, etc. for ARES/RACES operation. The radio needs to be able to run for long periods without worry of overheating etc. Also simple to operate for multiple operators. I haven't purchased a dual-band mobile radio for several years, so would welcome suggestions.

Unless you are a dx'er or contester in crowded band cdx, I would stick
with the stock 2.4 filter. The main effect of changing filters is
usually in the upper end. Most all filters drop to a fairly low value
on the low end. Or as far as speach is concerned anyway. A 2.4 filter
extends to 2400 cycles with a fairly flat shaping. A 1.9 only extends
up to 1900 cycles. Naturally, the wider filter sounds better. "crisper
mainly, due to the extra high end" If all stations stayed 3 kc away
from each other, there would never be a need for a narrower filter.
But the real world can vary from the ideal. Of course, the 2.8 would
give you the best audio, but the highest chance of hearing nearby
stations, if they are within or close to the edge of your passband.
BTW, in the real world, the filters still allow higher frequencies
through, but at a reduced db level. Most 2.4 filters actually hear out
to about 2.7 kc, where you will see a real steep drop off at 2.7 to
2.8 kc. A 2.8 filter could extend your passband farther than 3 kc if
the signals are strong enough. That means even a station 3 kc away
could be heard. So unless you are an audio buff, and can ignore the
extra noise, it's not really worth getting the wider filter either. I
need a CW filter in mine, but have no need for extra SSB filters. The
stock filter is good enough for gov use. MK

2843. I'm looking for ham radio kits

Hey guys and dolls,

I just finished building my first kit and I'm in the market for more. I'd love to find one in 20 meters but, other transciever or transmitter and reciever kits are interesting too.. Mebbe a tuner would be nice as well.. So, take a second and look over your shoulder at that box that old kit came in and knock the dust off it and let me know how much oyu want for it.

The Pixie II is a great kit and the price can't be beat if anyone is interested. It's 80 or 40 meters but, I'm tryin to see if it can be converted to work on 20 meters as well.

Thanks and happy homebrewing!!

Hi Dick. Tried to send this to you personally, but your e-mail rejected me.

Actually, I believe that you would be money ahead, if you went with separate VHF and UHF commercial gear like Motorola. A good majority of the gear can be tuned up or down to ham frequencies. As readily available and as cheap as this stuff is on the newsgroups, even Ebay, (yes even cheap on Ebay...sounds like an oxymoron LOL), it would be the best route to go. Commercial gear can be dropped from a 10 story building and still function as before. Leaving them on for
extended periods of time is no real strain on their ability. A lot of comm. gear is used around here for repeater stations and they run continuously for years without much upkeep. Look around, i've seen a lot of the comm equip for sale that offer free programming to your frequencies. When it arrives, its just plug and play !! You will just need to label each channel (dynamo label perhaps) to identify what it is.

If you go this route, you will need monoband VHF and UHF antennas respectively. The power supply (or supplies) will have to be 25 amp or greater to power the rigs.

Just my .02 worth !!

Thanks Chris. I always forget to say to remove the 33 from my
address. I would prefer to use a dual-bander because this equipment
will be put in some kind of portable case to move between locations,
and 440 will rarely be used. It's just a backup to the normal 2-meter
frequencies. Antenna will probably be a Diamond X-50 as that is what
we have at all the fire stations, etc. It's a good performer, and
very sturdy.

MrMexico-

You may have missed the question about IC-4AT vs IC-04AT. They are two different radios.

I have the older IC-4AT. It did NOT come with PL capability. It was necessary to sandwich a tiny PL tone generator board between two larger boards in the radio, and the tone is permanently set by soldered jumpers. It can't be adjusted without a major disassembly and re-programming the jumpers.

Setting frequency and offset is easy on the IC-4AT, as Mark indicated. I have never used the IC-04AT, but recall it is quite a bit more sophisticated. For either radio, "tuning" might require a service manual if yours is off frequency.

A web site that has quite a bit of information including some downloadable manuals, is http://www.mods.dk/ which I think is in Germany.

Hello OMs:

Does anybody here have experience with the process for removing the
RECTIFIER UNIT from a FT1kD radio?

For the AC line fuse holder to clear the hole in the Rear Panel, the
RECTIFIER UNIT must be shifted laterally and then lifted vertically
from the radio. It appears that either the radio's Rear Panel or its
power transformer must first be separated from the main chassis.

Which approach, the Rear Panel or the power transformer, is best ?

Please advise.

>

Have you first removed the mode selector knob and ring to see if the switch nut is visible and accessable from the front? If it is, you should be able to tighten it with a fine pointed needlenose pliers.

If not, I'm not sure how much you want to dig into this. You must first remove the two screws on right side of the bottom plate, 4 screws on the left side of the bottom plate, and the 4 screws on the bottom of the bottom plate. I think you can, at this point, remove the bottom plate without having to remove the top assembly. (Top assy: remove two screws on top front, and two screws on back of radio ... I think you have to remove the key jack nut, too).

Once you get the bottom plate off, you can see the back - bottom side of the control panel. Unfortunately, there is a nice big PC board there and I don't know what the situation is at this point with the mode selector switch, but you can at least assess and proceed on your own from there.

Hi, still did not get your name or the date you got your license.
It is on the ticket. What color paper was your license printed on,
Blue or green??

The 4at has volume, squelch on top.
Also, set the numbers on top to the frequency you want.
On the back set the offset, plus or minus or center for simplex.
That's it.
Have fun...

Try the ten tec web pages and look at the 1300 series of qrp
transceiver kits. I'm just finishing up the 1320, a 20 meter rig, and
look forward to gettting it on the air today.

If he has set the PL tone, in all likelyhood he has the 04AT. That is, unless the 4AT has an add-on CTCSS board. Possible, but not likely. If you can find a manual for the 02AT, the operation should be pretty much the same. There's not much on the 'net about the 02AT either, according to Google. You might have to try one of the online sources that sells manuals, such as http://www.w7fg.com/ .

BTW, he gave his callsign twice, once on the original post and once in reply. Try checking QRZ if you want his name and license date (29 Aug 2003). Freshly minted ham, as it were. Welcome, Will!

Hello,

It's not bullet-proof, but the Yaesu FT7100 has an idiot-proof running mode where only the memories can be used with no frequency tuning capabilities. Very convenient when using the alphnumeric memory labelling.

There must be other duoband rigs handling this mode.

The FT7100 has also digital (packet abilities) up to 9k6 bauds limited to a TXDelay of 16 (160ms).

I am able to see the switch nut, but there is little space to get in
there - even with a fine pointed needlenose pliers.

I have removed the cover and I can see the backside of the mode
switch, but i need to access the switch nut from the front. I think I
have to remove the front panel. Should I remove the VFO knob and how
is this done?

Back into amateur radio after having to sell it all cause of a divorce.
I picked up on Ebay a used Yaesu 757GX.
First question is on the display. When the Clarifier is off and in VFO mode, should there be a digit displayed where the channel number would be if memory was selected?

Secondly, it wont hold channel memory so it must be the battery is dead.
Where would I locate it?
Thanks Steve n8nyu

He may have given his callsign twice (if it is his callsign) but he never
replied with his name
or answered the question, is it a 4AT or an O4AT.
Makes me wonder how hard a 2AT / 4AT is to operate.
It is a joke to work it.
Wonder why he never replied to the group with those answers?
Now, either he is not a ham and just a troll trying up be a smart ass wondering
how many folks can help him with
this simplest of radios or he really does not understand the concept of radios
at all. Does he have a problem
with his AM broadcast radio also??
Also, a Freshly minted ham who just received his ticked a few short weeks ago
should be able to tell me when he got
his ticket.
After detailed explanation of how to "tune" the frequency (2 times) he still
asks the
same question. My guess is he is not a ham.
P.S. of course I looked him up.

2875. Upconverter Weirdness

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-12 20:53:43 UTC
From: donrm@soco.agilent.com
Message-ID: <1063400023.451927@cswreg.cos.agilent.com>
Source record: 26898
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

See if you can figure this one out.

I recently bought a used Palomar VLF-A converter and am experiencing a strange frequency offset problem. WWVB 60 KHz appears about 5 KHz low on the upconvert receiver, in this case a TS-130 transceiver.

This converter was evaluated in the January 2000 pg 59 issue of _QST_ and the author had the same problem, only in his case the receiver was an ICOM IC-706.

When operating the converter into a direct conversion receiver WWVB comes out on the correct frequency. Suspecting a problem with the VLF converter's LO (3.5 MHz in this case), a peek at this LO signal with a high-end spectrum analyzer shows a clean output with very little phase noise, no spurs and exactly on 3.5 MHz.

BTW, I tried replacing the MC1496 active balanced modulator with a Minicircuits SRA-6 passive DBM, same result. I don't suspect any problems with the upconverter receiver's LO either.

So - what's going on?

DO NOT CONSIDER THE FT-7100, unless you need a paperweight.
It's IM rejection is non-existent. I bought one and sent it back to
YAESU for the IM "fix". It now sits in a box in the cellar. It's
USELESS.

I don't know. You might try, (at risk of breaking it), to remove the rubber "band" that is on the VFO switch and see if there is a set nut under it. I don't know. Maybe its just a tight fit and just pulls off. Hopefully someone else can answer that here.

NO.

> Secondly, it wont hold channel memory so it must be the battery is
> dead. Where would I locate it?
> Thanks Steve n8nyu

I believe it is a solder on round flat watch type battery located on
a pc board behind the front panel. It should be on the bottom middle area
I think.

YOu do not get an extra digit. If you press the up or down buttons on the
mic you will see that it will tune in 10 hz steps as it will take 10 clicks
to move th displayed digit.

For a manual to download for free on the rig go here:

http://www.cqham.ru/sch_eng.html

and look way down the page past the first listing of Yaesu.

2880. Westid Goldden electroplate U/S

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-12 22:40:49 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3f624b6c$1_2@news.vo.lu>
Source record: 26903

The company WESTID.COM that sold until early 2003 callsigns badges on goldenelectroplates gave up this business after the death of Jim Glenn's father.
See an example of their product here
http://www.astrosurf.com/lombry/Radio/badge.jpg

As his soon does no more answer to any mail and didn't accept any order we can conclude this company does no more provide this service.

And I hear there is a lot more problems with that rig.
the mic audio for one.
It's a shame Yaesu did not turn any of them on before
they left the factory. :-(

2884. FA: 3- NOS 2A3's - RCA - ends Saturday

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-13 02:39:51 UTC
From: Tom <tfarl@iowatelecom.net>
Message-ID: <Xrv8b.426458$YN5.289141@sccrnsc01>
Source record: 26908

Ending Saturday the 13th at 12:47:01 PM PDT (1947 GMT).

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2191021059&category=7275

I got these from my friend, the old organ tuner. I've had nothing but good experience with the tubes I have received from him in the past. He bought these new about 35 years ago, as best as he can recall. He used to use a lot of 2A3's back then. There's not that much demand for them anymore in this Iowa town of 900.

These are "garden variety" RCA 2A3's, i.e. not "black plate" or "single plate" or anything exotic like that.

Of course any RCA 2A3 is kind of exotic anymore.

All three tubes have been tested on a mutual transconductance tester to make sure everything is as it should be with N.O.S. units. Everything is. If by any chance a problem arises with these tubes, please contact me within 3 days of receipt and return them (with filaments intact). I will issue a full refund plus 2 X shipping upon verification of tube identity.

Thanks for looking,
Tom - "theponyengine"

2887. LDG AT-11MP Auto ATU kit

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-13 08:18:08 UTC
From: Andy <dx90@blueyonder.co.uk>
Message-ID: <%oA8b.3929$QO6.859@news-binary.blueyonder.co.uk>
Source record: 26911

Has anyone built an LDG AT-11MP Auto Tuner kit and managed to setup/calibrate the meters correctly with out any special gear to do this?

I am thinking of buying one in kit form but I can't find the instruction manual for it on the web. I need a manual to help me to decide whether to buy the kit or a ready made one if the kit is too hard to build and calibrate.

Can anyone help with this?

Many thanks

Andy

Here are a bunch of items for sale. Prices do not include shipping. I
will ship overseas.

"Rare" James Millen Model 90800 Transmitterï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½..$135 plus shipping
A crystal controlled 50 watt transmitter from the 1940's using a 6L6
driving an 807 with plug-in coils. It requires an external power supply.
Main coils are missing so it is untested. Includes a copy of the
schematic.
http://members.cox.net/radiostuff9/millen_xmtr.jpg
http://members.cox.net/radiostuff9/millen_xmtr3.jpg
http://members.cox.net/radiostuff9/millen_xmtr4.jpg
http://members.cox.net/radiostuff9/millen_xmtr5.jpg
http://members.cox.net/radiostuff9/millen_xmtr6.jpg

National MCN Dial ? New in the Boxï¿½ï¿½..$50 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Set of James Millen Wavemeters with the original storage case........$70
plus shipping
These are from the early 1950's. The units and case are in excellent
condition however a previous owner engraved ID info on the case. The
unit numbers and frequency ranges are as follows:

90619.......350-1000 kHz
90620.......150-350 kHz
90625.......2-6 MHz
90626.......5.5-15 MHz
http://members.cox.net/radiostuff9/millenwavemeters2.jpg
http://members.cox.net/radiostuff9/millenwavemeters3.jpg
http://members.cox.net/radiostuff9/millenwavemeters.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½$10 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover on
one is broken but the unit is OK
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

Sprague TO-4 Capacitor Testerï¿½ï¿½ï¿½..$135 plus shipping
This unit is in excellent condition and works great. The front panel
still shines like a new unit. Includes a copy of the manual
http://members.cox.net/radiostuff9/sprague_to4.jpg
http://members.cox.net/radiostuff9/sprague_to42.jpg

ZM-3A/U Capacitance Analyzer.....$125 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet.
http://members.cox.net/radiostuff9/zm32.jpg

JAN 7293 4CX250 plus socket and Eimac SK-606 Chimneyï¿½ï¿½..$40 per set plus

Shipping. Tubes and chimneys appear to be NOS. Sockets are used. I have
four sets
of these
http://members.cox.net/radiostuff9/4cx250.jpg
http://members.cox.net/radiostuff9/4cx2502.jpg
http://members.cox.net/radiostuff9/4cx2503.jpg

Eimac 4-125 plus Socketï¿½ï¿½ï¿½ï¿½..$75 plus shipping
Tube appears new. The brown color in the glass is a reflection off of
the beige background. Socket is used.
http://members.cox.net/radiostuff9/4-125.jpg
http://members.cox.net/radiostuff9/4-1252.jpg

Eimac 450TH/VT-108 Transmitting Tube - $50 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

79 Crystals ? various holdersï¿½..$2 each plus shipping or $50 for the
whole lot plus shipping FT-243,CR-1A etc. The frequencies are between 6
to 8.5MHz. I saw a few
40 meter 7080 kHz crystals. These are untested.
http://members.cox.net/radiostuff9/crystal_lot.jpg
http://members.cox.net/radiostuff9/crystal_lot2.jpg
http://members.cox.net/radiostuff9/crystal_lot3.jpg
http://members.cox.net/radiostuff9/crystal_lot4.jpg

Gonset Communicator III - 2 Meters.....$90 plus shipping
This is a separate receiver and and crystal controlled transmitter which

I believe is from the late 1950's or early 1960's. I fired up this radio

and heard my signal generator and a few slope detected FM signals on 2
meters after hooking up an antenna. I do not have any crystals for 2
meters so I was unable to test the transmitter. The radio appears to be
complete. It does have a number of scratches. I don't have a manual but
they are available from a number of sources on the Internet.
http://members.cox.net/radiostuff9/gonset_com3.jpg
http://members.cox.net/radiostuff9/gonset_com32.jpg
http://members.cox.net/radiostuff9/gonset_com33.jpg

Heathkit Electronic Switch Model S-2 with original manual....$20 plus
shipping
http://members.cox.net/radiostuff9/heath_switch.jpg

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$35 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

good condition externally with a small tear in the grill cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

RCA Capacitance Testerï¿½ï¿½..$35 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with
a mirror. Works great.
http://members.cox.net/radiostuff9/rca_captester.jpg

Barker and Williamson Coil Mounting Barï¿½ï¿½..$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Triplett VTVMï¿½ï¿½ï¿½ï¿½..$35 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

From: AL KA5JGV <ABurzynski@nojunk.satx.rr.com>
Message-ID: <1wG8b.5615$z32.2667@twister.austin.rr.com>
Source record: 26916

For Sale: $150.00 for all items below.
I will not ship, you pick up in San Antonio, Tx.
Receiver weighs about 70 pounds.

1.Signal Corps US Army
Radio Receiver BC-342-M, SN 397
RCA Manufacturing Co.
Camden, N.J.

2. Original, not a photocopy:
War Department Technical Manual TM 11-4001
Repair Instructions for BC-312 and BC-342 Receivers
War Department, February 1945

3. Photocopy of Operation Manual and additional
notes with schematic diagrams.

The receiver is the 120v (not dc dynamotor) type
and works properly. Some modifications were made
but they are of the gain improvement variety (replacing
cathode resistors and such). Modifications are documented.
Includes control cable CD-566, 2 mounting brackets, and
original schematic on metal plate that was originally
mounted inside the receiver.

Receive frequency is 1.5 to 18mc (MHz for you young troops),
and includes a crystal filter. The unit requires an external
speaker and 2-prong power cord. Use of a 2-prong power cord
causes 30-volts to appear between chassis and 3rd wire neutral.
I suspect there are leaky power supply capacitors.

If you're interested contact me at
ABurzynski at satx dot rr dot com

Wow, now I see what you mean. I just looked at my own link and was
surprised to see that their manual no longer includes the construction
instructions. I have owned 3 or 4 AT-11MP's and every one of them came with
a manual with construction instructions.

I would contact Dwayne at LDG and ask him if he can send you the
construction info as an attachment or something. They are great people!

I built mine. The only tedious part is winding the toroid coils. I think they are available pre-wound. The assembly instructions are clear and the board is easy to stuff and solder. Calibration only involves a few watts from a transmitter and a Digital Voltmeter. If you have done
any electronic assembly before, you should have no problems. I noticed that the difference in price
between kit and assembled is only about $40. You don't save that much. I just like to do my own
assembly.

>Secondly, it wont hold channel memory so it must be the battery is dead.
>Where would I locate it?

It is near the upper right corner of the *local unit* board, looking
down into the rig with the top cover removed. The owner's manual
doesn't address the battery replacement issue, but the FT-757GX
Technical Supplement shows its exact location on page 38. You can also
refer to page 15 in the Supplement for a visual of the local unit
board layout. Pretty easy to replace.

Does the Motorola NTN1171A Charger (for the MT2000) handle NiMH batteries?
I'm seeing conflicting info on the net & can't locate any info at Motorola.
If it is compatible, is it limited in the size battery it will handle?

Thanks,
Tim

Tim..check with a Motorola MSS on this one. I had a "bank" charger for 8 Motorola Astro Sabers and when we switched from NICAD to NiMh batteries it would fail(to flashing red). After moving a set of jumpers in it, it began to work correctly. Your MT-2000 charger MIGHT be in the same boat...Eddie

I concur. My earlier post was in error as I was looking at the Piezo
sounder unit behind the front panel instead of the memory battery.

2916. Re: Yahoo Group for Radio Shack DX-394 Users

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-14 16:01:43 UTC
From: Tom Holden <holden_family@sympatico.ca>
Message-ID: <n609b.106$mv6.24564@news20.bellglobal.com>
Source record: 26939
Cross-posted to:
rec.radio.shortwave,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Welcome to the RADIOSHACKDX394 group!
http://groups.yahoo.com/group/RADIOSHACKDX394/

Here you will find a community of users of this dandy little tabletop LW/MW/SW receiver/scanner. Some members are keen short wave listeners; others are into AM DXing and a few enjoy long wave. Many experiment with antennas and some are ardent modifiers - customising and souping up the rig as hot rodders would do with cars. You'll find lots to interest you and help get the most out of your radio.

The group would like to hear from you. Send a message to introduce yourself. Tell us what you like to do with your DX-394 and what you would like to find in the group. It's as simple as sending an e-mail to RADIOSHACKDX394@yahoogroups.com. A suggested subject is "Newbie from (your location)".

If you have subscribed by e-mail, please proceed to register on the website so that you can enjoy all the resources available there, only to registered Yahoo members who have joined the group. You'll need to associate the e-mail address from which you sent the subscription request with your new Yahoo ID. As a registered member you can control the frequency that group messages are sent to your e-mail account - individually, daily digest, Special Notices only, or never.

Here's what's currently available, just a few mouse clicks away:

Message Archive: over 1446 messages as of Aug. 23/03. Use the search tool to find content of interest to you. Post messages right on the website or by e-mail.

Links: probably the most complete collection of links to other web sites and resources having something to do with the DX-394. Each one is described so you can speedily pick the most relevant ones. Try out the Google Search link for checking the latest on Usenet groups about the DX-394.

Files: certainly the most complete and comprehensive collection of modifications, explanations, and tips for this radio - all the 'famous' Frank Cathell mods from Usenet group rec.radio.shortwave are here along with recent ones by Tom Holden and others - and it continues to grow. Members are actively developing computer control, external Digital Signal Processing interfaced at 455 kHz, 455kHz/12kHz downconverter for interfacing to sound card for PC-based DSP, and simpler ones such as 1/4" phone jack, SSB Clarifier, etc. Look here for a comprehensive index with over 50 entries: Mods List. Have you got a mod to offer?

Photos: a growing collection of photos of modified rigs and of DX-394 shacks. Upload a photo of your set-up - no matter how simple or messy, with you or your cat in the picture, too!

Database: See the Survey of members. In one convenient spot, read what others are using their DX-394 for, what antennas and accessories they have, mods they have done or plan to do, what they like/dislike about the receiver. Take a couple of minutes and contribute your input to the survey - in fact, do that first and let us know you have done so in your first posting!

Members: over 450 as at Aug 23/03! You can browse the list and maybe find someone in the same city; it's possible to send a message to a member privately via the group's message server, even though you cannot see the member's full address.

Polls, Chat, Calendar: these resources are not regularly active. Maybe you have a suggestion and would like to initiate something.

Etiquette
Group membership is subject to approval by a Moderator to control spam-bots. Messages, however, are immediately reflected without Moderator approval. We want to keep it that way as long as the postings are on-topic, spam-free, use language and express opinions that we would be happy for our children to hear. The group Moderators will exercise their rights and responsibilities to delete messages and to remove or ban members that, in their opinion, violate these basic principles.

When you reply to a message or add to an ongoing thread, please trim off all or most of the previous person's text before you send your message. If you need to keep some of their text because you might refer to it, please hold-back only the amount needed so the readers can understand the dialog. Please strip away everything else. Why? This will help readability for all, and be especially beneficial to our friends in digest-mode.

Help - Trying to connect Ameritron AL-572 Linear Amp to TS-570D. Amp
requires Shielded audio type cable with a standard male phone plug
connected to the "Relay Jack" on rear of amp.
Question is which pins do I connect audio cable to in the "Control
Relay" plug on the TS-570D???
Thanks in advance.
Bill

2918. Icom IC-27020H

Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

I've got a few PC's in nice metal cases. I can actually run most of my receivers near the PC without too much problem, as long as the receiver is powered by batteries. But the instant I hook my sound card to the receiver, or I run the receiver off of AC power, all the SW bands are filled with S9 hash generated by the computer and network equipment.

What's the most economical and reasonable way to deal with this? Will RFC's on the power, ground, and sound lines be good enough? Those snap-together ferrite cores from Radio Shack help a little, but not nearly enough. In a few weeks my computer-controlled TenTec RX-320D arrives and I want everything to be in ship-shape by then.

The computer equipment isn't "just a computer". It's several PC's, an Ethernet hub, a DSL router, a UPS, etc. By experimenting I've discovered that the computers themselves aren't so bad... but the networking stuff (a necessity, I'm afraid) is abysmal.

The situation is serious enough that I'm seriously looking into optical fiber links... anyone have advice for a low-budget solution that way? If I can put the RX-320D upstairs away from all the Computer stuff, and run the audio and RS-232 over optical fiber, I'd be in heaven. While I know where to start for RS-232 over fiber, I don't know anything about the available audio-over-fiber options.

Tim.

2920. FS: RigRunner 4005 Power Panel

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-14 17:53:20 UTC
From: Keith V <kavan@neb.rr.com>
Message-ID: <kW19b.10004$ZL3.3955@twister.rdc-kc.rr.com>
Source record: 26943

A RIGrunner is the most convenient and safest way to connect all your 12 VDC equipment to a power source. It is a 13.8 VDC power panel that uses the excellent Anderson PowerPole connectors. Five outlets all individually fused. See at: http://www.westmountainradio.com/RIGrunner.htm
New in factory box. $37.50 shipped Conus.

I have a long 1/8" M-F extension cord from my line-in on my computer
to my radios... had the same problem. Cutting the female connector
off the end of the extension cord and soldering another one on but
leaving the shield off solved most of the problem. This broke the
ground loop.

If that does not work, and since Radio Shack stuff is normally
readilly available, they sell a Ground LP Isolator (270-0054) that
should do the trick or you can roll your own using their isolation
transformer (273-1374) which is $4.

I have for sale a very nice condition 51J-2 receiver.
The front panel is cosmetically about a 9 of 10 and not a repaint.
The receiver has the correct band change knob and meter but no top cover.
The receiver has the Lankford product detector mod and performs GREAT.
Pictures available to interested buyer. $400 shipped to Continental USA.

There's a yahoo group that covers the radio -- take a look at it.

http://groups.yahoo.com/group/IC-2720H/

I've had one for a while, and like it. The yahoo group has
instructions on things such as cross-band repeat, as well as the usual
mods.

It looks like you have to mod the rig to get it to
correctly select the optional filter
in AM mode.

Ref: Computer noise..

FWIW..I started this crusade back about 4 years ago to get
the noise out of my Icom radio.

The following is my track to a quieter system:

1. Got rid of the UPS system. It has a switching
power supply..they are cheap and radiate rf all
over the place. I moved to the Mandrake-Linux
OS..didn't really need the UPS..the OS has a file
system that takes care of itself on power failures
etc. It can recover after crashes.

2. When I got a new computer, I made sure that the
power supply was not the switching type and that
it was shielded and the latest FCC specs were
adheared to. Also, the newer cases have rfi
grounding and are shielded better.

3. Later changed to a quiet Router by Netgear.
The wall-wart bar power supplies on the wall
that was used a couple of years ago are also
the cheapo switching supplies that radiate
noise all over the house.

4. Went to a quiet DSL modem. The newer Zoom DSL modems
are state of the art..super quiet power supplies and
silent DA converters.

5. Fixed a noisy florescent light in the kitchen upstairs.
Noisy starter.

6. Went to a Flat panel monitor by Samsung. Much quieter
than my old regular 17inch CRT. This was one of the
main noise generators on my system.

This all over a 4-5 year period. Now I can listen to my
Icom receiver while browsing the net, the receiver is
within 4 foot of the Flat panel LCD monitor. Also, I
put in a RS 4 ft. ground rod just outside my window
for the Icom receiver.

Anyway, it can be done..but, it takes time and some
money.

Good Luck,

Leonard...

Hi Harold,
I just bought 3 sets of these at a hamfest at a hamfest 2 weeks ago near Saratoga, NY. Both ends are threaded so you can screw any of the tips in either end of the leads. For instance, I screw the banana plugs in the one end to fit my meter and the alligator clips or pointed probes in the other end to best suit the connector that I am trying to meter. The kit even comes with spade type adapters to fit under a screw terminal for a secure connection that won't fall off. They are really nice test leads. I got them at a bargain price so I bought 3 sets as I seem to have a habit of misplacing things.

The problem isn't ground-loop related; the problem is horrible with even
battery-powered receivers plugged into the sound card. Interference goes from
minor before I plug it in, to S9 hash all over the SW bands after I plug
it in.

I already tried isolation transformers. The capacitive coupling through
the isolation transformer (measured to be about 100pF) lets way too much
noise through... the net effect of the isolation transformer is a very
minor improvement. Better grounding on the receiver side would probably
help here, I'm going to drive a rod down just for the receiver soon.

Perhaps a grounded receiver + an isolation transformer will do the trick.

If that doesn't do it, it looks like fiber optics will be the solution.

Tim.

Dale,

I've had mine for about 9 months. Run it mobile in the trunk of a 2000 Saturn Wagon with the control head on top of the dash panel. On-glass dual-band antenna for day-to-day operation and a 5/8L mag mount for fixed public service events.

I find it to be a FB radio once it's programmed and you're into regular operation. Programming, compared to my previous three mobile rigs, is not intuitive. You might even call it tedious! I always carry the manual along in the glovebox.

I've used crossband without problem in a few situations. I've also NOT discovered the IMD problem that other users report. However, I'm about seven miles outside the urban Allentown, PA area, so the strong signals are a few miles away...

One negative is the mic mounting plug in the control head. It's an RJ-45 connector that takes a lot of strain. After ~ 6 months use, I had reports of low audio. Turns out the connector had worked itself so it no longer had a good contact. I rigged a strain relief for the cord and the problem has disappeared. I miss the 8 pin standard mic connector of old, but there just isn't room for them on the small modern day control heads!

Good luck on your decision. In my opinion, it's a great radio for the price.

I've wondered that too. I have suspected that there may be a set screw
UNDER the rubber grip ring on the knob. I have never tried to remove this
rubber ring, so I don't know for sure. If the radio is very old, and the
rubber getting to be brittle, it may break if you try to remove it.

2944. Interstage filtering between FM RF amps?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-16 00:46:34 UTC
From: fornewspost@aol.com
Message-ID: <20030915204634.14223.00000952@mb-m18.aol.com>
Source record: 26867

My question is whether I need interstage filtering between two 900MHz saturated amplifiers in an FM (FSK) transmitter. One stage is the driver amplifier outputting about +15dBm, and the other stage is the PA, outputting +30dBm. I want to keep parts count and insertion losses down, but do I need such filtering to keep mixing products to a minimum, or is the standard TX output bandpass filter all that I need in an FM system?

Many Thanks!

Mike

2945. info, accessories for TR-711 DEI receiver

I still have a DEI TR-711 telemetry receiver. Apparently these have
been popular so I hope someone has a tech manual or some additional
plug ins. It has some nice features (say for radio astronomy) like
bandwidth controls and plug in IF filters, AM and FM demod,
etc. My unit has a front
end for 50-200MHz for instance. Anyone have anything else on or for
this 1970's receiver?

If you didn't try it use a choke on the ground lead with the isolation
transformer. The ground lead probably let the noise around the
transformer.

2948. LAR HF Omnimatch info

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-16 10:13:04 UTC
From: rwnixon@hotmail.com
Message-ID: <31501aee.0309160213.5a238c75@posting.google.com>
Source record: 26871

Hello everyone,

I've got an LAR HF Omnimatch which covers 1.8 - 30 Mhz, but although I've searched the web and google groups I can't find any information about it.

The power rating is marked as 200W, but I would like to know what sort of circuit it uses. Can it be used to tune a long wire or "any length doublet", or it is really only good for matching an antenna that is slightly off resonant length?

Also, someone told me that although it only has an unbalanced antenna connection it could also be used with balabced line feeder. Is this true?

I would be very grateful for any information received. Ideally I would like a copy of the manual for this item, and would be willing to pay all costs.

Thanks in advance

Richard

>
I own an RX-320. When I first hooked it up, I used a long wire antenna which tended to be quite noisy. Was using an old (100mhz) computer with low quality graphics. Built a folded dipole with (tv) coaxial input to radio. Installed it in my roof. Everything became quiet.

I have since replaced my computer and monitor (high power, high quality graphics, high refresh rates, etc.) and everything is still quiet. The radio is less than 2 feet (as the mosquito flies) from the computer. I still occasionally use the long wire to monitor the HF band edges and MW/LW frequencies.

Information on the antenna can be found on Yahoo Rx-320 group (groups.yahoo.com/rx320 message 2471, dated May 18, 2002.

2950. A good wattmeter ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-16 15:21:23 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3f672a75_2@news.vo.lu>
Source record: 26873

Hi OM's,

I would like to buy an external wattmeter able, in the future, to check the power emitted by a 1-2 km Amplifier (kenwood TL 922 or another high-end). There are a lot of models, from the portable Bird43 using a single niddle to the MJF 817 and alike using a dual system, crossed niddles, or even digital, but it must first be able to support a PEP of 2 kW.

As a dual system similar to the MJF model, there is the vectronic,
http://www.vectronics.com/vectronics/products.php?prodid=PM-30 (3 kW)
Another good one seems to be the ameritron 30X
http://www.ameritron.com/ameritron/products.php?prodid=AWM-30 (2 kW)
but in both models the scale seems too small and not easy to read.
The Autek looks fine too but it is not powerful enough,
http://www.autekresearch.com/wm1.htm (100 W)

What are good models able to meet my specs ?

Thanks in advance

Thierry:

I've got one of the Autek WM1 units, and it has a switch on the front that allows you to select 20, 200 or 2000 watts for the range displayed. According to their ad, the meter is protected from slamming against the right side of the range in case you have selected too low of a range. I typically use it with an Ameritron 811H, which puts out 600 to 800 watts on a good day and the WM1 seems to work just fine...

I prefer a separate meter for SWR and Power like the WM1 has, because I really don't like the crossed needle approach. With separate meters, a glance will tell you whether things are OK, while you need to interpret the display of a cross needle unit.

Thanks

BILL- WAS HOPING TO HEAR FROM YOUR INQUIRY ABOUT 8877's LAST
WEEK.....ESPECIALLY SINCE YOU OFFER $700 FOR A PAIR OF 8877'S AND SAID THAT
I WOULD SELL YOU A PAIR OF THEM FO $660 DELIVERED TO YOUR DOOR. THESE WOULD
BE EIMAC PULLS, TESTED, FULLY OUTPUT, AND GUARANTEED!!!
LET'S DO SOME BUSINSS

RICHARD HALE
Bill:

Tubes are my ONLY business, I have been selling them for about 12+ years,
and I am not going anywhere.....I stand behind everything that I
sell....and the 8877/YU209/3CX1500A7 have been tested and they are at full
output, your satisfaction is assured,. If for some reason they don't
operatre as expected, I will etiher replace them or refund your money. You
would need to advise me of any disastfaction within a reasonable amt of
time...can't be expectred to extend the 'guarantee' for a undefined
perioid of time...I have sold probably 100+ of these tubes and I have NEVER
had a single one to come back....

SO, if you want them (2) your price would be:
$320/ea x 2 = $640 + $10 shipping + $10 COD fee = $660 delivered to your
door OR you can send me a MO for $650 and save the $10 COD fee.

IF you have any questions, please feel free to call me.

Regards,

Richard Hale

2958. Westinghouse RF43W070 Portable Radio AC Adaptor Needed

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-17 00:22:47 UTC
From: lcunning@columbus.rr.com
Message-ID: <rPN9b.3736$cK5.3589@fe1.columbus.rr.com>
Source record: 26881

Hello all,

My girlfriend's father was a correspondent for the Voice of America for many years, and before he died a few years ago he gave her a Westinghouse Model RF43W070 portable radio that he had taken with him on his assignments to Africa and Asia. The radio is in pretty much like-new condition, with the exception that the AC adaptor has been lost. There is a jack for a "9V adaptor" on one side, but I have no other details about the sort of adaptor this would need. She would like to listen to the radio more, perhaps more for old-times sake than any other reason, but she would prefer not to have to run it off batteries all the time.

Does anyone know where I can find an AC adaptor that will work with this radio? I'd love to surprise her with one if possible. Any information would be much appreciated.

Thanks in advance,

--Larry

Bird 43 works, as does a Telewave. Diawa makes a few. It all depends on use
and accuracy required. I didn't see the original post of this to know the
intended use.

The FT757 was a forerunner to the FT890.
I believe they both use the same type dial.
The FT890 has a setscrew underneath the rubber
ring on the dial. The instructions in the owners
manual on setting dial tension tell you how to
remove the knob.

the critical thing is to get the polarity right on the adaptor. so one fine day when you're over there with a small DVM in your pocket, and she skips up to the can or out to weed the garden or something, slip the back off. fire up the meter, put one probe on the outside conductor of the adaptor, and touch the other one to both of the battery leads, each in turn. one will give you voltage if you are not watching the interrupted lead on the adaptor jack... if you don't get voltage either way, you need to look more closely at the adaptor and find the outside lead before it is interrupted.

once you get a reading, note the polarity (useful if you use the red lead to chase the adaptor jack so you and the meter are both clear about where you are seeing things.) if polarity at the red lead is positive, then the center has to be negative. if you see -8.56 volts or similar, the center has to be positive.

find an adaptor and plug at radio shack that fits, fit the magic plug the right way to put the polarity the right way, and you are in like Flynn.

get it backwards... well, depending on how they made the radio, if there is not a diode that shorts the adaptor plug if you hook it up backwards, ugly can happen.

I have a Bird 43, which works fine, but is inconvenient to use, if you
want to compute SWR. You have to go to the instruction booklet and lay
down pieces of paper on a nomograph, which is a hassle.

Most of the time, I just use the cross-needle meter on my MFJ-989C
tuner. It shows watts out at a glance -- just look at the "forward"
needle. And so long as the "reverse" needle is not moving, I know the
SWR is okay. I'd imagine any of the MFJ stand-alone SWR meters would
work equally well. Just choose one for the appropriate power.

The MFJ meter is only about 2.5" wide, but is quite easy to read.

2966. Modifying Lafayette SWR & Field Strength meter?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-17 12:15:00 UTC
From: Ken <cprstn54zz@att.net>
Message-ID: <h1kgmv4q4akeoh5ngjk1u3mat6ga22da7a@4ax.com>
Source record: 26889

I have been told that there is a well-known, simple mod for converting
an old Lafayette SWR & Field Strength Meter (#99-25835) and similar
meters into 2m/70cm SWR/power meters.

Can someone please point me to some documentation for the mod?

From: Pappy@usa.net
Message-ID: <3F68737E.1E342B99@usa.net>
Source record: 26890

Bill, you should check your owners manual.

Be sure to turn on the "amp control relay", it is located in the menu
setup - item #39 on page #18 of the manual.

Use RG-178 coax. Check page #81 for the pin connections.

Mine work perfect.

Let me make this much easier. I pulled my plug and checked the
connection just for you.

Solder the center conductor of the coax to pin #5
Solder the ground of the coax to pin #2
Put the cover back on the connector, plug it in and your on the air.

2970. FT 920 modulation problems

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-17 18:53:49 UTC
From: David L Thompson <thompson@mindspring.com>
Message-ID: <152ab.28242$NM1.27791@newsread2.news.atl.earthlink.net>
Source record: 26893

I ran the FT 920 on 6 meters in the Sept VHF Party and was told by a local that my audio was tinny and thin. I had the menu U-51 set to high to match the HC-4 element in the BM-10 Heil boom mic set. I then tried another Heil (pro Micro) with HC-4 element and a telex Contester Boom mic set. The Pro Micro was some what better, the Telex (same response as the HC-5) sounded like a stock Yaesu mic (very bland). I then went thru the U-51 setting and found that 3 (high and low emphasis) worked best with both Heil mics.

Is there any other menu items (maybe hidden ones) that I can adjust? Both Heil mics work great on the other Yaesu gear (980, 990, 1000MP).

Hi Dave,

On SSB I hope that you have set the carrier offset ?
Check menu # U-59 and U-62. I found that with my voice a setting of (-225) was just right. This will put lows into your audio and I also found that the equalize setting of "OFF" is best for the mic.
Good luck
Chuck

Source record: 26700

I have a RadioShack DX-398 Shortwave Radio 4 Sale. This radio is the same as the Sangean ATS-909 except the AC adapter and reel antenna are not included and the color is black.

For additional information see the following Internet web pages:

http://www.grove-ent.com/ATS909.html

http://www.transistor.org/collection/radioshack/radioshack3.html

http://www.rnw.nl/realradio/ats909.html

A copy of the DX-398 Owner's Manual:
http://support.tandy.com/support_electronics/42500.htm

I have the original box, manual, and the carrying case.

The DX-398 is in excellent condition and works fine. The selling price of $110.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

Are you talking about the input VSWR to the amp?
I am not sure I can translate your VSWR readings, but if you are saying the
input VSWR on 40M is 1.5:1 and 1.9:1 on 10M, seems acceptable to me.

The easiest thing would be to go to the hardware store or Radio Shack,
and get one of their universal AC wall transformers that provides
multiple voltages, multiple-size plugs, as well as a switch to go from
positive to negative polarity. Try out the various plugs and voltages
-- or just go to 9V -- and try the polarity switch both ways. The
radio should power right up. These multi-voltage transformers run
about $10-$15.

Let's not forget that this is a newsgroup for discussing amateur
radio equipment. It's not a buy and sell group.

So any of his ads, whether cameras, guns, or ham equipment, don't
belong here.

Source record: 26719

I have a Mirage 3016 whose preamp seems to not be working. I was hoping someone on here might be able to give me some advice in what might be wrong with it.

When its on SSB, the preamp seems to do nothing to the signal/noise. When on FM, it seems to actually attenuate the signal/noise. Past experience with preamps has always been that when you flip these things on, EVERYTHING gets amplified including the white noise. Just curious if anyone else has had this problem and if so what was it? What can I change out to maybe fix it?

Thanks for any info!

Jason

Pins 1 and 5.

> Also I know it is a 5 volt tube
> and 14.5 amp.do I really need that much to make it glow?

Yes, you do.

> Would 12 volt work?

For a very, very limited time, providing your 12V supply is capable of
dishing out 40A. If it's not, it would either clamp down to the maximum
current or trip the breaker.

If all you want to do is make it appear that it's glowing, build in a
few LEDs into the wood base. None will be the wiser.

You sure don't want to put 12 volts on it unless you want to burn out the filament. It needs 5 volts. The transformer will have to supply the 14.5 amps or it will not hold up, either. There are 5 volt transformers out there which have no center tap that can be bought pretty cheap since they won't work out easily for use in an amplfier..

isn't that going to get it hot enough in time to crack the seals? had
some guys working up a linear in 1971 at NDSU that just had the
filaments on a pair of 4-400s without the fan on, and killed 'em with an
ugly, loud cracking noise.

orange LEDs would be more authentic, I think, than red ones to make a
glow in the firebottle.

I need the default menu settings for the s-meter calibration. This menu is accessed by shorting pins 8 & 9 (ground & PTT) on the accy plug, then pressing and holding the [LSB/USB] & [N.R.] buttons down while powering up the radio. This brings up the service adjustment menu. I need the values for menu items 2,3, 4 and 5.

I would be interested in all the menu values if someone could e-mail them to me so I can keep the information in the service manual.

Thanks,

Max

Dear All,

Codar CR 70A Communications receiver

I have recently been given one of these (part of the left-overs from an SK's estate). The poor thing has been butchered somewhat, and the butchery was never completed. I'd like to get it going again but haven't been able to find a circuit diagram or manual on the web. If anyone has one or can point me at a source I'd be very grateful. I'll reimburse your costs, of course.

vy 73

Andy, M1EBV

p.s. please reply to news:uk.radio.amateur as I don't read r.r.a.boatanchors or r.r.a.equipment every day. TIA

12 volts will burn out the filament.

You might be able to try less than that. However, try an old computer
power supply, they should be able to give you either 3.3 volts at a
lot of amps, or 5 volts at a lot of amps.... I'd try the 3.3 volts
first, since you want a gentle glow, not the full filament.

John,
Perhaps I'm misinformed about the purpose of this group. I started this thread, and I thought it was about making a homebrew antenna/network analyzer.
How did it get into the category of commercial equipment?

Joe

That's certainly possible, although it will cool better convectionally out in the open than inside an amp enclosure. It surely would get pretty hot, about as hot as a 75 watt light bulb in use would. You wouldn't want to touch it at that temperature

> orange LEDs would be more authentic, I think, than red ones to make a
> glow in the firebottle.
>

That's probably the best way to go, eliminates all the current and thus the heat. But nothing will show up like the original filament glow.

I suggest applying a lower potential, say 4 Volts. That would make the glow a more orange color, maybe more impressive, without risk to the filament and a lower bulb temperature.

On the other hand, are you sure this tube is defective? Good tubes are worth around $100 and I'm sure you can find a shorted one for very little.

Due to the high current drawn by the filament, it's common for a poor socket contact to cause excessive heat at the tube pin, melting the solder and causing the filament to go out. There are many tubes out there that have been scrapped with the thought that the filament is burned out, when in fact the tubes are repairable. (I just repaired one for a fellow amateur.)

Very good point. I've done the same. Poor filament contact is fairly common
especially when used in older amps.

Dick

3015. Antenna: Glass mount or ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-19 20:49:13 UTC

Message-ID: <JWJab.173$gi2.4@fed1read01>
Source record: 26738

(Was Re: ICOM IC-T7H or IC-W32?)

Thank you to everyone for your continued responses. I'm logging them all to make my final decision.

Allow me to add a few more details to the aforementioned info...

Although my first thought was a mag mount antenna, I have a '94 Jeep Wrangler with a fiberglass hardtop. Because of that, it was suggested to me to get a glass mount for the front window (as the other windows would be removed by removing the hardtop). I do have a metal lockbox in the back that a mag could mount to, but then the antenna would be inside and I understand that's not ideal.

The reason I'm currently looking into a HT is simply finances. While some day, I hope to have a base station in every room, a mobile in every vehicle, and a HT for every occasion, I can only afford one radio at this time (and I have to save for awhile for that!). I'm looking at a HT because of versatility: I can use it in my home, in my vehicle, or walking down the road. I'm hoping to extend it's range with the additional antenna and use a speaker/mic or some sort of headset to facilitate mobile use.

Any further thoughts/ideas/suggestions based on this additional info? I'm open to any and all comments.

Thank you again for all your help.

Struggling to get back on the air...

Then its the added coax to the system. And/or the internal wiring from in
to out via the relay.

That better ??

You have blown out the transistor, of fet, or whatever it uses in the receive pre-amp. And/or you have blown out the protective diodes, if it has any.

Fiberglass topped jeep? There are a couple options. I don't like glass mount. Personally, I have experienced poor matching or excessive losses with these. If I had your vehicle, I would consider a 1/2 wave base loaded antenna for 2M that doesn't require a ground plane. These are readily available from most decent mobile antenna manufacturers. Also, I would consider a trunk lip mounted antenna fastened to the edge of your hood if possible. There's enough metal on the front of the jeep to make that fairly effective..... more so than a glass mount antenna, in my opinion. Or if you didn't mind drilling a 3/4" hole on the hood space between the front windshield and the hood itself, you could mount a decent NMO type mount there. That, too, would be reasonable effective. I don't think the Fiberglass top of the jeep would impact any front mounted antenna enough to be concerned. Only concern is RF radiation to the cab occupants. If you don't run too high power, or tx too much, that should not be an issue, either. Good luck.

I second the motion for mounting on the hood. When not wanting to
drill a hole my new vehicle and also not wanting a mag mount I used a
Diamond K-400 mount with a Larsen 2M/440 antenna (half wave) and have
found it to be suitable. With luck, there's already a hole in the
firewall to pass the coax through. If only using an HT I wouldn't
worry about RF exposure.

A Tip for routing cable or DC wiring through the firewall. Most new vehicles have the large electrical cable bundle coming through the firewall with a large rubber grommet holding them. There is usually space enough between the edge of the firewall hole and the cable bundle to punch or cut a hole in this thin grommet to push the additional wires through. CAUTION! Be very carefull you don't slip and damage any of the wires in the cable bundle.

I have for sale a very nice condition 51J-2 receiver.
The front panel is cosmetically about a 9 of 10 and not a repaint.
The receiver has the correct band change knob and meter but no top cover.
The receiver has the Lankford product detector mod and performs GREAT.
Pictures available to interested buyer. $400.

In article <oiG8b.6787$NM1.4490@newsread2.news.atl.earthlink.net>,
gilpi@mindspring.com says...
> Im looking for a Heath HW-7 HW-8 or HW-9 or any other similar QRP/low power
> rig. I would like to stay under $100 and the rig can be working or not.
> Please email me with details.

I wouldn't go with the HW-7. There were some design problems. The HW-8
is a good one, but I would suggest trying to find an HW-9 with the extra
band pack installed. It would probably go past your $100 price point
but it would be worth it.

3040. RG-316 to RG-58 connector

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-20 19:58:38 UTC
From: nospam@nospam.com
Message-ID: <nospam-54D768.14583820092003@hermes-ge0.rdc-kc.rr.com>
Source record: 26813

Anybody know what connector I need to connect RG-316 to the PL-259 or go direct to the rigs SO-239? Any help will be appreciated by me and another ham. We are using the RG-316 for mobile installation because it's easy to snake thru small spaces.

Dale, K9VUJ

Why don't you go fuck yourself?

No one cares about the assclowns on night time HF. Every one is a loser.

I hope Riley eventually finds and ass fucks every one of you.

Here are a bunch of items for sale. Prices do not include shipping. I
will ship overseas.

"Rare" James Millen Model 90800 Transmitterï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½..$135 plus shipping
A crystal controlled 50 watt transmitter from the 1940's using a 6L6
driving an 807 with plug-in coils. It requires an external power supply.

Main coils are missing so it is untested. Includes a copy of the
schematic.
http://members.cox.net/radiostuff9/millen_xmtr.jpg
http://members.cox.net/radiostuff9/millen_xmtr3.jpg
http://members.cox.net/radiostuff9/millen_xmtr4.jpg
http://members.cox.net/radiostuff9/millen_xmtr5.jpg
http://members.cox.net/radiostuff9/millen_xmtr6.jpg

National MCN Dial ? New in the Boxï¿½ï¿½..$50 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½$10 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover on
one is broken but the unit is OK
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

Sprague TO-4 Capacitor Testerï¿½ï¿½ï¿½..$135 plus shipping
This unit is in excellent condition and works great. The front panel
still shines like a new unit. Includes a copy of the manual
http://members.cox.net/radiostuff9/sprague_to4.jpg
http://members.cox.net/radiostuff9/sprague_to42.jpg

ZM-3A/U Capacitance Analyzer.....$125 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet.
http://members.cox.net/radiostuff9/zm32.jpg

JAN 7293 4CX250 plus socket and Eimac SK-606 Chimneyï¿½ï¿½..$40 per set plus

Shipping. Tubes and chimneys appear to be NOS. Sockets are used. I have
four sets
of these
http://members.cox.net/radiostuff9/4cx250.jpg
http://members.cox.net/radiostuff9/4cx2502.jpg

http://members.cox.net/radiostuff9/4cx2503.jpg

Eimac 4-125 plus Socketï¿½ï¿½ï¿½ï¿½..$75 plus shipping
Tube appears new. The brown color in the glass is a reflection off of
the beige background. Socket is used.
http://members.cox.net/radiostuff9/4-125.jpg
http://members.cox.net/radiostuff9/4-1252.jpg

Eimac 450TH/VT-108 Transmitting Tube - $50 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

79 Crystals ? various holdersï¿½..$2 each plus shipping or $50 for the
whole lot plus shipping FT-243,CR-1A etc. The frequencies are between 6
to 8.5 MHz. I saw a few
40 meter 7080 kHz crystals. These are untested.
http://members.cox.net/radiostuff9/crystal_lot.jpg
http://members.cox.net/radiostuff9/crystal_lot2.jpg
http://members.cox.net/radiostuff9/crystal_lot3.jpg
http://members.cox.net/radiostuff9/crystal_lot4.jpg

Gonset Communicator III - 2 Meters.....$90 plus shipping
This is a separate receiver and and crystal controlled transmitter which

I believe is from the late 1950's or early 1960's. I fired up this radio

and heard my signal generator and a few slope detected FM signals on 2
meters after hooking up an antenna. I do not have any crystals for 2
meters so I was unable to test the transmitter. The radio appears to be
complete. It does have a number of scratches.
http://members.cox.net/radiostuff9/gonset_com3.jpg
http://members.cox.net/radiostuff9/gonset_com32.jpg
http://members.cox.net/radiostuff9/gonset_com33.jpg

Heathkit Electronic Switch Model S-2 with original manual....$20 plus
shipping
http://members.cox.net/radiostuff9/heath_switch.jpg

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$35 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

good condition externally with a small tear in the grill cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

RCA Capacitance Testerï¿½ï¿½..$35 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with

a mirror. Works great.
http://members.cox.net/radiostuff9/rca_captester.jpg

Barker and Williamson Coil Mounting Barï¿½ï¿½..$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Triplett VTVMï¿½ï¿½ï¿½..$35 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

Hmmm, 3.894.5 is a rather unique way to express it. Accuracy always commands
respect.

Since when did it become a "private" frequency? The H.F. Frequencies used for Ham operation are open to any one with the proper class of license to use them. Of course common courtesy does count when the frequency may already be in use. No wonder people are turning away from Ham. It is getting horrible. Used to be, I boasted it to anyone interested. Now, I tell them not to waste their time. It is getting to be High Power CB. As for the FCC, they have lost the battle so far as I'm concerned. The horses are out of the barn. TOO LATE! I'm about ready to sell all my ham gear.. Get my cash out of it while there is still some value left to it. I would NEVER buy a new rig again, that is for sure. I'll buy "used" if I decide to stay in it. It just isn't worth the huge cash lay out.

Lou

If I choose to talk on that frequency, I will, so long as I'm abiding by the
rules and regulations as they are spelled out. YOU or no one else, can tell
me to stay off. ASS WIPE.
.....
Good thing old Rich Whiten is gone...THAT was a radio Hog times two....
The old YI YI song reminds me of Rich's selfish stupidity as he keyed over
all but a few of his chosen "butt buddies".
Rich would, in his arrogance, ignore all Hams who weren' t running
megawatts....of course old Rich got caught running over the legal
limit...among other things.
Story is that Rich got pissed and sent his resignation of his license to
Riley Hollingsworth. Riley accepted the resignation and rescinded Rich's
license.
Enter another story...Rich is now claiming that his letter of resignation
was sent "by mistake" to Hollingsworth and Whiten wants his license back.
Sorry, Rich. Your weak story ain't holding water up this way.
Gosh...how does one send email "by mistake"?
Rich is full of it...he screwed up out of anger and now he wants to take it
all back. It doesn't work that way.
Porkbutt Song.....YI, YI, YI.....

Hi,

I have an old TS-850, it have been with me for over 10 years now.

Lately it have periodic low receiver sensitvity on 40m.
Signals seems to be att. atleast 20 to 40 db.
This happens when switching from tx to rx, sending a "DIT" or two restore
full sensitivity.

It can happend in 7 of 10 tx/rx switching.

Any suggestions?

73,
Asle - LA6IHA

Hi. My display has gone berserk. When set on known freq.7.000, for example, the display reads 7117.1.

As I move up freq., the .x digit jumps by 2, ie, to 7117.3

On 20 meters, the reading is 15xxx.x throughout the bands. There are other such anomalies. Operations otherwise seems OK.

Does Kenwood has a tech support URL?
Any thoughts greatly appreciated.

Source record: 26748

<< I have been told that there is a well-known, simple mod for converting an old Lafayette SWR & Field Strength Meter (#99-25835) and similar meters into 2m/70cm SWR/power meters. >>

Ken-

I don't think a modification is required per se, other than removing the field strength antenna. The instruments I'm familiar with are reflectometers, similar to the design of many wattmeters such as the Bird 43.

You need to provide a power scale for the knob used to set full scale for SWR readings, to set the full-scale power range. It may be as simple as using a magic marker to indicate the settings for various full-scale readings such as 10, 100, 1000 watts.

If it has a field strength scale in addition to the SWR scale, that may be used to read actual power. However, it will probably NOT be linear. In other words it most likely will read voltage rather than power, so you would need to have a conversion chart to convert from the scale reading to actual power. I would expect to find that center scale would indicate one quarter of full-scale power, but you will need to verify actual calibration.

For very low power levels, maybe one watt or so, you can expect additional non-linearities due to the forward voltage drop of the detector diodes.

The ones I have used in the past seem to work as is on 2 meters for SWR.
They may not be too accurate but will tell you when you get to a low SWR on
2 meters and teh 220 Mhz band. Not too sure how much power they will handle
but seem to work up to 30 watts. They will not work on 440 mhz as the line
is too long.

If the sampling lines are cut down to a shorter length they will probably
work on the 440 mhz band. This I have not tried as I now have Bird and
Struthers meters.

Its also awful small diameter. I can't help but wonder what the losses
are for that.... gotta be worse than RG58, maybe?

If snaking coax in tight spaces is your concern, I'd at least look at
the Motorola white Teflon cable used a lot currently for commercial mobile
installations. It has the physical attributes of the RG316, but is a
little bit bigger, thus a bit lower loss. I don't recall the generic
type number, but a Google search should turn up something under Motorola
White Teflon coax. Connectors are more readily available for this than
what you have.

IF the meter wasn't touted as a "CB" meter, most of the
FS/SWR/Modulation/Wattmeters I've seen were usually good from 3.5 to 150
MHz. 220/440? Hmmm. I don't know. Accuracy would tend to be off a bit more
I'd think. But hey, that is what makes Ham fun, PLAYING. IF it IS listed as
a CB meter, usually - of the ones I've seen - were/seemed pretty much
limited to 25-29 MHz.

IF you have the instructions for that meter or the box, it should tell you
the range(s). Otherwise, going from memory here, it seems I've read where
a/the diode(s) had to/could be swapped out. Seriously, I'd do a check of it
with known conditions first to see if it displays anything near what you
know to be the case. Example: if you know the SWR on a rig's antenna system
is 1.5:1, then the meter in question should show something close at that
frequency. IF you know the power out, again, the meter should measure close.
I've always checked any cheap meters against my bird 43 to see how close
they are before using in the field for field day or prior to selling. IF

that meter won't do what you want, there are usually meters available used at Hamfests or on E-Bay that will do the job. So long as the meter movement is ok, the rest is repairable with or without a schematic depending on experience. You can usually get a meter movement as well, but by the time you get done screwing around, you can buy a working unit.

I have a very clean PW1 for sale. Don't need two amps, have an Alpha 87A that I use most of the time. Will pay for shipping (lower 48). Has all the hookup cables and remote control head. Has 10/12 meter mod included. Instruction manual included. New ones going for over 5k. Asking $3500 delivered. Contact Stu, W6TA, at 310-544-8226 or email to w6ta@arrl.net

3083. Kenwood TS-450 repair

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-21 21:22:35 UTC
From: nowhere@james.net
Message-ID: <3f6e0ffc.5299917@193.70.192.192>
Source record: 26756

I wish to repair my own Kenwood TS-450S-AT and to begin from somewhere, I'd like to know what other 450's users think of the current situation:

1) When I power the rig, I have no audio at all and no trasmitting. The display shows a row of dots. If I move the main dial, the frequency appears normally, but if I release it, after half a second the dots appear again.

2) Some other times, when I give power I have both audio and trasmitting and the display works well, but the audio in SSB/CW modes is totally distorted, while it is ok in AM/FM modes. However after 5-20 minutes of rx, the situation becomes that described at point 1.

3) I have read of the battery problem in the 450, so I found the lithium battery and measured it. It gives 3.28 V, is that normal? Since the rig is approaching ten years I think I will change it anyway, but I don't know if it is a problem now!

4) On the bottom side of the rig, near the place for the 455 kHz cw filter (I have the 8.83 one, so this place is empty), there is a 3-wire connector labeled "W3". The short cable, with a similar connector on the other side, is attached to... nothing. But I don't see any place to attach it, even if I look at the whole board. Unfortunately I lack the 450/690 service manual and I did not find this connector on the istruction manual schemes. This MAY be normal, though.

My conclusions, for now:

a) When things are ok, except for SSB/CW, the problem should arise in the second IF at 455 kHz. Either the CAR Unit does not give a correct 455 kHz carrier or something is wrong in the IF mixer chip or near it. In fact this chip is used only in ssb/cw/fsk modes.

b) When the rig is almost dead, perhaps there is something wrong in the digital/display unit. Lithium battery? Some digital chip, which one?

c) Also the mere power could be a problem. My supply, 13.8 V 40 A max, looks good, but internally there are circuits to obtain the different voltages required and these could be damaged.

I am mainly looking for the service manual (someone has scanned it?), but all other advices are welcome.

James

I didn't see the power rating of that cable you described, but it
sounded like RG-188 type also. I suggest you go to:

http://www.belden.com and check the catalog for 50 ohm transmission
line. There were several Teflon jacketed cables there that I think would
be a better choice. Or stop by a two way radio dealer and ask about the
Motorola white Teflon jacketed cable they should be aware of. Perhaps
they might have an extra un-used length for you?

3086. COMMON IF FREQUENCIES FOR LMR & HAM GEAR

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-22 00:27:10 UTC
From: **THE-RFI-EMI-GUY** <NoSpamBogus@NoSpamBogus.com>
Message-ID: <3F6E41DE.5050808@NoSpamBogus.com>
Source record: 26759

I am trying to compile a spreadsheet of common IF frequencies used by VHF, UHF and 800 MHz land mobile and amateur gear. Apart from the standard 10.7 and 21.4 MHz first IF and 455 KHz second IF frequencies, there are a number of "odd" IF freqiuencies in use.

This information will be used to make a database for determining local possible oscillator frequencies leaking/emanating from radios.

For example a Standard C508A radio receiving on 442.575 MHz will emanate an LO leakage on 442.575 - 23.05 MHz (First IF) = 419.525 MHz.

I would appreciate response (to this thread not my "bogus" e-mail address) from anyone who has knowledge of odd IF freqs:

Please respond as follows:

Manufacturer: Standard, Model C508A, First IF: 23.05 MHz, second IF 450 KHz.

Thanks for help with this project.

W3 connects to the TU-8 tone unit, which uses DIP switches to generate one
of about 40 PL or other tones. This would only be activated if you enabled
the front panel TONE switch, and probably would only be useful on FM.

My unit draws a solid 20 amps when transmitting, and if the power supply is
set to current limit at that point, it will do so. I'm using an Astron
VS-35M supply set to about 14v and full current, which should be good for 35
amps max, and have only had a problem when the current limit was set lower.
I doubt your power supply is a problem on receive, unless it's very low
(less than 8 volts) or very high (more than 18 volts).

The lithium battery should be used just for memory retention, and they're
normally around 3.6v, so 3.28 isn't too bad, but probably time to be
replaced anyway. My unit is 11 years old and I should look into the same
battery replacement in mine.

The rest of your symptoms are very strange. I can offer no help at all.
Obviously something is wrong, but I can't even begin to tell you what to
look for.

One simple thing to try: loosen and retighten all screws that
hold down circuit boards; wiggle all jumper connectors, so
they are reseated and the contacts wiped a bit. This cured
several really strange problems on my very old TS-930.

Hello,

Can I use one of those cheap ol' Walmart power strips to as an isolation transfomer (I need to work on my TS-940), or will I need to get a real isolation transformer to prevent a ground loop.

The reason I ask, is that about 15 years ago while in tech school, one of my buddies was working on a TV (NOT plugged in to an isolation transformer) using an OScope (NOT plugged it to an isolation transformer, either), and boy was he really suprised when that probe scratched against the chassis on the tv set.

3092. 2-meter rig for sale, $50

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-22 04:57:17 UTC
From: En.TAKETHISOUT.ginuitastic@Gee-Enginuity.com
Message-ID: <2f986907.0309212057.367a13ea@posting.google.com>
Source record: 26765

Sorry if this gets posted multiple times... Outlook Express was giving
me wierd errors.

I have a KDK FM-2033 2-meter rig that I'd like to sell.
It's a basic 2-meter FM rig at 25 watts, tunes 142-152, has 12
memories
(plus a "call" position that you can set to 146.52 or whatever) and
can do
special splits (like for ISS use) as well as standard 6khz splits for
repeaters. It also has a scan function that works for both the
memories and
the manual-tune mode. There is a five-segment LED bar graph that
functions
as an s-meter and an output power meter. It has a nice mic handset
with a
DTMF pad and up-down buttons, and I've added an external microphone
jack and
a switch to disable the internal mic. The rig has a "TONE" button that
activates an internal PL board (set by a potentiometer), but I have
had
little luck setting it up, so no guarantees there.
Pictures on request. The rig is guaranteed to work on arrival (no
guarantees
past that), and comes with a power cord (runs off 12 volts). Asking
price is
$50, and I can take PayPal or check. If paying by check there may be a
delay.

Email k123@Gee-Enginuity.com or call 408-323-9761.

Oh, by the way, I have written up a little informal "manual" for this rig (including connector pinouts and all control functions) since the real one is hard to find. I'll print out a copy and send it with the radio.

4382 virii currently quarantined in Postini for my benefit... 20 have
sneaked through and been gutshot by Snortin' Futilities Antivirus...
have already deleted 1500 virii friday and saturday and gave up to see
what the count rises to. so we're around 5600 for the weakend.

and there were folks at my home ISP who had 4800 by noon saturday.

clearly these script kiddies are not very clever... they could have
directed all this excitement to, say, whitehouse.gov or verisign.com,
and done something useful. or to microsoft.com, where by rights they
really belong :(

if you are servicing hot-chassis equipment, It Is INCUMBENT that you
power it through an isolation transformer to avoid becoming worm bait.
nothing else is safe.

the other way to say that is you don't use one, you die and/or burn the
place down and also kill the gear you're working on.

I got a nice 500-watter from a surplus outfit for $40 a couple months
ago. forget the name of the joint, something like skyline surplus just
outside cape canaveral. google for it, or do a search on slashdot,
which is where I got twigged to it.

you will also find this is an item that surplus stores can't keep in
stock, so they keep making deals and offering them. there is no good
reason except having way more money than you can bear to spend several
hundred dollars for one with a test-equipment company name on it.

A power strip is NOT an isolation device at all. You want to use a
transformer that completely isolated primary and secondary windings.

depends on how the rig is powered, but with a standard 3 wire plug,
you only need an isolation transformer if the chassis can be raised
above ground level. In something as sophisticated as ham radio gear,
where the chassis IS connected to ground, I'm not sure why you'd need
one.

If you need one, though, it's really cheap insurance.

Mostly needed in cheap TV sets and AC/DC radios, where the chassis is
directly grounded to the neutral of the AC line.

My Unix gSnot devaluator doesn't recognize those terms and they all came
up in Chinese characters on my mailreader after it enountered the fact
that you actually COUNTED 4382 virii.
Might you have a set of Dymo labels in this language that I can tape
onto my computer box? Red would look best.

> look for.

They are very common. Kenwood potted the main PLL in a rubber compound to isolate from thermal changes and mechanical shock. In plain English to slow down the effect of temperature changes and prevent frequency jumping if you tapped the radio, or when mobile went over a bump.

The problem is that over the years the rubber compound started to absorb water from the air. If you were in a totaly dry enviornment this would never happen. I have an R5000 (same problem). When I lived in the U.S. I kept the radio in a basement that was so wet everything would rot in a few days, so we kept a dehumidifier running and the basement was very dry. The radio never had a problem.

After sitting in a box and then a freight container over the ocean, it picked up enough moisture to fail in about 3 months.

The fix is simple in theory and is documented on the Kenwood web site. You remove the shield from the main PLL, remove the rubber compound, replace any parts damaged due to corrosion and readjust the PLL.

An experienced technician, such as Cliff at AAVID, can do it for about $100 for parts and labor. Unless you have the correct tools and equipment, I'm not sure you can do it, but many people have.

Geoff.

The TS450's do NOT use the compund that caused so many problems in the
TS440's. I have owned both.

> The fix is simple in theory and is documented on the Kenwood web site.
> You remove the shield from the main PLL, remove the rubber compound,

AS I said there is no compound in the 450.

If you are experiencing a row of dots on your display, this is a sign your
VCO is out of lock. If you can borrow a service manual, it is very easy to
realign.

Well, actually, there is such an item and it looks like an ambulance but is
full of communications equipment (kind of a cool idea). Scroll down to the
bottom of the page and see the pic with all the radios (row 4, col 2). It
still may be a waste of time but you should be the judge of that, not Sam
Taylor.....

Sure....

Click on 'tools,' 'message rules,' click the mail (or 'news,' to set similar rules for the news client) tab and set up your rules there. You can set parameters for the sender, the subject and the recipient. You then have twelve different actions to choose from if the post meets the criteria. The 'options' button allows you to further modify the rule.

FWIW; so far I've got a dozen senders, at least that many subject lines and even more recipients listed to block this mess. Between all that, AND BellSouths 'MailGuard' feature--which belatedly set up a spam-block on many of the criteria I used (presumably)--I'm still getting several a day.

It'll die down soon...I hope.

HICKORY, NC [UPDATE]: The FCC wrote General licensee John A. Abernethy, K4OKA, July 27, 1999, modifying his license to prohibit operation below 30 MHz for 180 days, effective immediately. Unless he appeals the action, Abernethy may not get back on HF until January 22, 2000. The FCC letter included a copy of a tape recording--supplied by complainants--of transmissions said to be of Abernethy's station on July 16. Hollingsworth's letter described the tape as "consisting of deliberate interference on 3.965 MHz." In the letter, FCC Attorney Riley Hollingsworth, K4ZDH, noted that Abernethy had been warned about deliberate interference at the time his station was inspected last January. Abernethy has 30 days to protest the sanction. FCC personnel inspected Abernethy's station January 21 and 22 in the wake of what Hollingsworth called "longstanding complaints from other amateurs and from our field offices." In particular, he said, the FCC had received "numerous complaints" about profanity, obscenity, deliberate interference, and failure to properly identify. Other complaints to the FCC alleged that Abernethy had aired something called the "Porkbutt Song," the letter said, "for the purpose of harassment or deliberate interference." Hollingsworth said the FCC's High Frequency Direction Finding Center in Maryland tracked the transmissions of the "Porkbutt Song" to K4OKA. The FCC letter also said the Commission had received complaints that Abernethy had used AM and upper sideband on 75 "for the purpose of interference" on or near 3894.5 kHz. Abernethy also was warned in the letter about over-power operation. Hollingsworth said that the FCC has no plans to start revocation proceedings against Abernethy "unless we have evidence of continued violations" of the type the FCC described in its July 27 letter. (For additional details, see "FCC Takes North Carolina Ham off HF for Six Months" elsewhere on the AWE news page.)

I wonder if FCC knows he's up to it again?
Maybe we should refer them to this NG...
I don't know if it's such a smart idea for him to brag about his illegal activities on a public newsgroup which is archived by servers everywhere for permanent storage. Especially when everybody knows exactly who he is.

Well, he didn't claim to be "smart". So, I'm sure, in due time he'll be busted again. Those who brag usually are begging to be caught or need severe help! Matter of psychology.

Does anyone have info on the MATEC 615 "tuned receiver" (that's how it is described)?

What is it, specs, when made, etc. I couldn't locate anything searching the web.

Thanks!

Sure can - this is from my ISP's tech tips page:

Use the following instructions to block a sender in Outlook Express 5.

- In your Inbox, highlight the message from the sender you want to block.
- From the "Message" menu, choose the "Block sender" command.
Click "Yes"

You can also filter out junk mail that contains commonly used words and phrases like "lose weight" or "buy now" in the subject line by creating message rules.

Use the following instructions to filter messages in Outlook Express 5:

- From the Tools menu, choose Message Rules and then choose Mail. If you have already specified a Message Rule, the Message Rules dialog box appears. If this is your first time specifying Message Rules, the New Mail Rule dialog box appears.
- Select the conditions for your rule. In this case you would select "Where the subject line contains specific words" option.
- Select the action you want Outlook Express to perform. In this case you would select "Delete it."
- Click the underlined text in the Rule Description area to specify more details on your choices. This allows you to input the junk mail phrases you want Outlook to screen.
- Click "Add", then "OK"
- Type a name for the Message Rule and then hit "OK".

I have a 25-watt 2-meter mobile FM transceiver, with digital VFO tuning, backlit LCD, 12 memory spots + settable "call channel", 5-segment LED s-meter/output meter. It supports standard 6khz offsets, plus you can combine memory channels to do odd splits like for the ISS up/downlinks. It comes with the power cord and microphone handset. The handset has a DTMF tone pad and I've added an external microphone/PTT jack for use with a headset or packet gear. I have documented all of the features and controls because the manual is hard to find these days; I'll include doc's with the radio.
Model number is KDK FM-2033.

Feel free to make any offer. I won't be insulted by low offers; I just might not take them.

ygs6gk(NOSPAM)@Gee-Enginuity.com
(remove the obvious)

Thanks.

Better yet, killfile him and create a message rule like this:

Apply this rule after the message arrives
Where the Subject line contains '3.894' or '3894' or 'bigal'
Delete it

That way you not only kill the messanger but all the
inane followups to the thread - end of problem.

Ken

3150. searching manufacturer of callsign in electrogolden plate

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-23 20:21:45 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3f70ab5b_2@news.vo.lu>
Source record: 26625

Hi,

Can someone tell me where can i find a manufacturer able to design a
callsign in a electrogolden plate like this one
http://www.astrosurf.com/lombry/Radio/badge.jpg (size is about 8-10cm high,
3-4")
or made in any other resistant material (metal), optionally coated.

It was sold by westid some years ago, but the company is not more in that
business.

Thanks in advance

Thierry

Not sure how the thread made it past my kill file, but to respond to your comment, I only went with what I was told and seen for myself as witnessed above.. IF there was more than one incident mentioned, then I didn't notice in my speed read of the article.
But, if it's been more than once, then maybe it's time they show him they're done playing games.
Lou

As most of you know, there is a troll on these boards claiming to be K40KA. I'm still trying to figure out whether this guy is just trying to be annoying. If he is actually doing what he said he is, we can go to the FCC, so I'd like to find out if he's actually on the air. Not owning any HF equipment, I can't do much my self. If somebody could listen in when he says he'll be transmitting...

Well first off, the reference violation above is long done with. He spent his time in radio prison and returned to the HF bands. He has basically learned his lesson, this time. And has been a decent operator for several years now.

What I was refering to was he was removed from the radio voluntarily in lieu of being fined a big chunk of bux back in the 70s. He stayed off the air for years. Returned as KJ4JX and began his crap again. He later got his original call back under the vanity system.

He has been a QRMer for many years. BUT as stated above has finally seen the light.

This crap you see here from "BIG AL" is BS.. And same for the "3894.5" crap. Its just a troll.

But I wanted to set the record straight.

Dan/W4NTI

It'd s troll. Big AL gets on occasionaly on 3894.5 and talks with whats left of his "Abernathy Radio Group". Without his Henry 8K of course.

So don't worry about it.

Serial Number 8L551464 with MH-36C mike. Taken from van broken into by smashing glass in sliding door. Antennas left behind; maybe frightened off by traffic. Entry to friend's yard gained by lifting gate off hinges on post. Unfortunately both pivot hinges pointed upward. If one up/one down, might not have happened.

Broken into by thieves on or about 13 January, 03. Parked on private property by tow truck after engine blew up on coast hiway. Had it towed to property outside Stayton, Oregon. Thieves broke sliding door window to access van. Stole about 2000$ of tools/test equipment and radios. Left antennas. Probably scared off, don't know.

The problem you describe was common in the TS-440. It does not occur
in the TS-450.

Hi

Set the radio to receive one of the noaa weather radio frequencies so
they it will
work when they turn it on. Plus, it won't xmt out of band if they try to
use it.

My ISP offers a virus protection and spam prevention service known as Postini. This scans all your incoming email for viruses and spam and quarantines them on their server. The virus carrying messages never reach your machine. You just check the quarantine file on the isp server from time to time to see what they have trapped. This allows you to dump them or transfer to your inbox (for messages caught by the spam filter that weren't really spam). Really a pretty neat system. Fully customizable for any level of protection you want. My isp only charges $1/month for it. Check with your ISP or check out http://www.postini.com/ . I don't have any connection with them, just a happy user.

Wayne, KEï¿½BZ

3192. FCC endorses BPL, another threat to ham radio

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-25 00:31:17 UTC
From: opcom <eccm@swbell.net>
Message-ID: <3F72521A.70F5BD12@swbell.net>
Source record: 26666
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy,rec.radio.shortwave

This was posted to ARLI, I don't know how many subscribe, but in spite of the numerous comments against BPL (transmitting wideband internet data over power lines, which will destroy the HF radio spectrum), the FCC seems disposed
to encourage it anyway. evil! evil! just look up BPL on the web. The noise from the radiated signals trashed the ham bands thoroughly.

From:
Amateur Radio Station N0JAA <N0JAA@aol.com>
4:00 PM

Subject:
[ARLI] FCC Commissioner's Comments Concerning BPL
To:
bvarc@clarc.org, clarc@clarc.org, ARLI@topica.com

The following is a transcript from a recent speech given by FCC Commissioner Kathleen Q. Abernathy at the United PowerLine
Council's annual conference regarding BPL. It seems that she is all for it. It also seems that BPL is going to become a reality, regardless
of what ARRL, the military, or anyone else says. As usual, big industry wins over everyone else because they have the money.

This is from today's FCC Digest.

Paul, N0JAA

Reaching Broadband Nirvana
United PowerLine Council Annual Conference Remarks of Commissioner Kathleen Q. Abernathy
September 22, 2003 (As prepared for delivery)

Thank you very much for inviting me to speak with you. I am very excited about broadband-over-powerline technology. I
have seen it in action, and I believe it has a very bright future. It is a real honor to be your keynote speaker at this
important juncture for BPL.

As a regulator, I am keenly interested in BPL technology for a number of reasons. One of my central objectives as an FCC commissioner is to facilitate the deployment of broadband services to all Americans. I also fundamentally
believe that the FCC can best promote consumer welfare by relying on market forces, rather than heavy-handed regulation. The development of BPL networks will serve both of these key goals. It will not only bring broadband to

previously unserved communities, but the introduction of a new broadband pipeline into the home will foster the kind of competitive marketplace that will eventually enable the Commission to let go of the regulatory reins. I
want consumers to have a choice of multiple, facilities-based providers, including not only cable and DSL, but also powerline, wireless, and satellite services. Such a robustly competitive and diversified marketplace is
something I would call broadband Nirvana. We will not get there overnight, but the continuing development of BPL technology is a major step forward.

While the long-term objective is a robustly competitive marketplace that is free of regulatory distortions, a more immediate question is: What should the FCC do to help foster such an environment? Sticking with my Nirvana
metaphor, I guess the question would be, what is the path to enlightenment?

I believe the answer, in short, is regulatory restraint. It is tempting for regulators to take every new technology or service that comes along and apply the same rules that govern incumbent services. After all, regulatory
parity and a level playing field are intuitively appealing concepts. But I believe that it would be a huge mistake to carry forward legacy regulations whenever new technology platforms are established. Many of our regulations
are premised on the absence of competition, and when that rationale is eroded, we must not reflexively hold on to regulations that no longer serve their intended purpose. In fact, many of our old rules not only become
unnecessary as markets evolve, but they can be fatal to new services that need room to breathe.

The Nascent Services Doctrine applying more stringent regulations to wireline providers at a minimum must be reconsidered. As other platforms, including BPL and wireless, become more widely available, that will further
undermine the justification for regulating incumbent LECs broadband services as if they were the only available offerings. When the Commission completes this rulemaking, I expect that we will eliminate many existing rules and
substantially modify others; the central question is the degree of regulation that will remain during the transition to a more robustly competitive market.

Finally, it is important to recognize that although the emergence of new platforms like BPL will eliminate the need for many competition-related regulations, other types of regulation may well remain necessary. For example, the
FCC must implement public policy goals unrelated to competition, or even at odds with competition. Universal service and access for persons with disabilities are examples of this kind of regulation. These public policy goals
generally should be applied to all service providers, to the extent permitted by the Communications Act. The FCC also must intervene to prevent competitors from imposing externalities on one another and to protect consumers
where market failures are identified. Although, as I have noted, the Commission was right to refrain from imposing heavy-handed price and service-quality regulations on PCS services when the were introduced, it was also right
to adopt strict interference rules to prevent competitors from externalizing their costs. The same principle will apply to BPL. They key point is that, while some degree of regulation is both inevitable and desirable, we
should ensure that it is narrowly tailored to the particular governmental interests at

stake. I appreciate the opportunity to share these thoughts with you, and I would be happy to answer a few questions if we have time.

The row of dots on the main display indicates that a PLL is out of lock..First, don`t attempt to repair the radio without an original service manual as it has colored coded voltage readings for rec and transmit etc..a copy will not show that..To repair this Kenwood is a pretty ambitious undertaking, if you have multi-layer circuit board experience down to the component level,and if you have a good source of Japanese replacement parts,and if you have micro-minature un-solder and re-solder tools and skills, then you have about 50/50 chance of being of making the necessary repairs..to make a long story short,send it to a cetified Kenwood service station.. Good Luck W4PQW

Cross-posted to: fr.rec.radio.amateur,rec.radio.amateur.equipment

Dear OM,

Some months ago I posted a message dealing with the fact that the Kenwood TS-570 series HF RTX was not able to generate 100 W PEP in SSB but rather something around 60 W on the antenna altough the RTX emitted well its 100W in CW.
As expected the OM who did the test, didn't made it correctly (do not speak about theory)... Bad news for him.
In fact this perfoming RTX emit well all its power...

I made some tests in depth in company of Kenwood engineers (Ref. Marconi Instruments radio test set 2967)
You will find the results hereunder. They will be soon added to my famous TS-570D page on
http://www.astrosurf.com/lombry/qsl-ts570.htm

See a summary in the table below.
73
Thierry, ON4SKY, LX3SKY

Bonjour aux OM et SWL,

Pour ceux qui en douterait encore, le Kenwood TS-570D, emetteur HF que j'utilise en portable, malgr&#65533; l'avis de certains qui soupsconnent une faiblesse &#65533; l'&#65533;mission, fonctionne TB et sort toute sa puissance.
La question &#65533;tait de savoir pourquoi en CW il sortait envrion 100 W et rien que 60W en USB.
En fait l'amateur qui avait effectu&#65533; ce test s'y est tr&#65533;s mal pris (ne parlons pas th&#65533;orie, enveloppe, etc).
J'ai r&#65533;alis&#65533; diff&#65533;rents test sur oscilloscope ainsi qu'un test direct en &#65533;mission chez Kenwood (Ref. Marconi Instruments radio test set 2967)
Voici un r&#65533;sum&#65533; des valeurs pour quelques bandes HF:

CW 5W 10W 100W
1.8 4.77 10.2 107.6
14.2 4.14 8.2 95.7
28 4.2 8.2 99.1

LSB 5W 10W 100W
1.8 4.8 10.6 108.2
14.2 4.1 8.1 96.1
28 4.1 8.2 96.2

USB 5W 10W 100W
1.8 4.8 10.2 107.2
14.2 4.2 8.4 95.1
28 4.0 8.2 98.6

FM 5W 10W 100W
1.8 4.6 9.5 108.2
14.2 4.47 8.89 106.4
28 4.53 9.09 107.6

etc.

Hope this helps or convince you of the high quality of this mid-range RTX.

Imagine never being lost while driving. Garmin makes it possible. Meet the StreetPilot III - the ultimate traveling companion and guide. Create a route and then put your mind on cruise as you follow clear, accurate, voice-prompted turn-by-turn directions to safely reach your destination.

The simple, intuitive menus of the StreetPilot III offer access to the shortest and fastest routes, directions, and estimated arrival time of your intended destination. Automated voice prompts alert you to upcoming turns, course deviation, and distance to final destination. At the touch of a button, view the locations of all the nearest highway exits, gas stations, restaurants, ATMs, hospitals, and rest areas on a full-color L CD.

The StreetPilot III comes with MapSource City Navigator CD-Rom and everything you need to download street-level mapsets from your PC. Then, just place the portable system on the dash of any vehicle, and enjoy stress-free driving and peace of mind-without any costly service charges or hook-up fees.

This unit is in mint condition and includes full unlock for the entire US and all accessories.

Asking $550 shipped

Hams are the least of the problems. There are many other users of the HF range who will be effected other than hams. Here's just a few:

US Coast Guard makes high use of HF
All branches of the military
Many long distance marine comms are still on HF
TransAtlantic and Pacific Air Traffic Control Comms are HF
(Imagine if the ATC ground station can't hear an Aircraft call is position).

And that's just a few services who are heavy uses of HF.

George
http://www.MilAirComms.com
With DSL who needs BPL?

Bonsoir,
On peut lui faire sortir ce qu'on veut (ou presque !) en allant dans le menu
des ri¿½glages 'usine".
A ï¿½viter d'aller bidouiller li¿½ dedans sans matï¿½riel de mesure hf serieux.

(re)Bonjour,

Il faudra que tu m'expliques ca en d&#65533;tail quand tu as le temps (ou sur
Echolink, hi!)
Sur la th&#65533;orie je comprends, c'est &#65533;vident, quand aux filtres l&#65533; ca commence
&#65533; me d&#65533;passer...
Je pense qu'il serait bon d'expliquer tout ca aux Internautes (sur ton site
si tu en as un voir sur le mien qui est &#65533; vocation p&#65533;dagogique)

A+
Thierry

Ou alors, si la mesure a &#65533;t&#65533; effectu&#65533;e avec

Je ne pense pas, la mesure a &#65533;t&#65533; faite directement dans l'atelier des
ing&#65533;nieurs de Kenwood &#65533; Bruxelles, chez Marconi Instruments.
Mais pour en avoir le coeur net je peux tenter d'obtenir + d'info sur leur
proc&#65533;dure de diagnostic.

3217. Frenchies, back to fr.rec.radio.amateur !

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-25 20:05:59 UTC
From: Thierry <tlombry@hotmNOSPAMail.com>
Message-ID: <3f734aa6_2@news.vo.lu>
Source record: 26690
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

Hi OM, YL, and SWL

This post is dedicated to all French spoken hams.
If sometimes in the past you posted messages on fr.rec.radio.amateur forum
you quickly discovered that this forum was invaded by CBists and "louts"
like Coman, JMBCV and other anonymous who aggravated this forum,
widespreading a poor image of amateurs radio activities.

Today, the radioamateur.org forum is temporary closed so hams have to think
back to use another forum like the first.

Hopefully, for a few months now, a few amateur radios, including me, are
trying to reverse the bad image given by fr.rec.radio.amateur, giving it a
new breath and the secret hope to develop this French forum.

So if you can write French and are interested in preserving the interest and
ham spirit of our community, I suggest you to post sometimes, the soon the
best, your post in French in fr.rec.radio.amateur so that this this forum
recover quickly all its health ;-)

Best 73's

Come join Electrical Engineering Hams at
http://groups.yahoo.com/group/eeham/

There are more electrical engineering forums than you can shake a stick at. There are more ham radio forums than you can shake a stick at. But until now, there have been NO forums dedicated to people who are both electrical engineers AND ham radio operators. You can think of Electrical Engineering Hams as the unofficial IEEE Amateur Radio Society. (No, it has NO offical status whatsoever!)

Fortunately, our HF bands are interleave in between
allocation for aeronautical mobile, maritime mobile,
DoD, private fixed service, short wave broadcasting,
etc.

I do not believe that we will be anywhere near close
to being alone in this battle.

If honorable you would have mentioned the new Garmin unit. The one you are offering is OBSOLETE. Doubt seriously if worth what you are asking.

Since you are here have nice cup of tea on me.

Here's what we do --- we built a (legal) KW rig into a van, install a vertical-
radiating antenna, cut out the roof and replace it with a fiberglass sheet. Drive directly underneath a power line with BPL running. Run lots of QSO's, and
have at it. We're legal. Induced RF just might make them think twice about it.

I'm sorry if I have offended anybody with my for-auction post, but at a glance I can see at least six other "FA:" posts on this NG and nobody has complained about any of them. Could somebody please explain what I have done to warrant complaints from three different people?
As for "selling extra stuff", if the buyer is concerned about this, I will list the item as a "buy-it-now" sale so that it will be covered by eBay.
I am concerned about how people view me both on eBay and the newsgroups, so if you have an issue, please tell me what I am doing wrong so I can correct it.

Do you mean the way CBers made channel 5 unwatchable 25 years ago?

I don't know much about BPL, but I think the TV analogy might hold. Given the bandwidth of BPL, there must be dozens, maybe hundreds of channels on the powerline. Can every one, or most of them, be wiped out? I'm thinking somebody came up with some pretty robust ways to deal with interference.

But what if it does stop BPL? BPL isn't being backed because it's a technically elegant system. It's being backed by politics. Rural areas were critically important in the last Presidential election, and any candidiate would love to say something like "MY OPPONENT IS STOPPING ONE FORM OF HIGH SPEED INTERNET DISTRIBUTION ON BEHALF OF HIS PALS IN THE TELECOMMUNCATIONS INDUSTRY, BUT I PROMISE TO BRING IT IN, RIGHT ON YOUR POWER LINE, AS SOON AS I'M ELECTED!!" Of course, that would be a political misrepresentation, but politicans get away with worse every day. Politics turns into a numbers game.

How many politicians or bureaucrats are saying anything negative about this goofy scheme? Politicians may not know physics, but they do know how to count.

Greg -- the answer to your question can be found at the rec.radio guidelines
at URL:
http://faqs.jmas.co.jp/FAQs/radio/personal-intro

Sez: The rec.radio.amateur .equipment group is NOT the place for buying or
selling
equipment, that's what rec.radio.swap is for.

Guidelines say -- rec.radio.amateur .equipment is for Amateur Radio Hardware
and software discussions.

Many folks post their FS FA WTB WTD items on all the newsgroups which
really is poor practice.
The rec.radio groups are broken down into several categories so one doesn't
have to see the same posts in all the NG's.
Just a way to TRY and keep order out of chaos.

However, it doesn't work well as folks do what they darn well please.
Since the groups are unmoderated -- little can be done about those who spam
all rec.radio NG's
The "at least six other FA posts" you cited are not following the
guidelines either. Doesn't make it "right"

Most everyone I know reads all of the rec.radio NG's -- so why spam em all
and be out of context on most of them ???

I am not playing NG cop -- just answering your question.
Continue with spamming all NG's if you want,
but be prepared for some heat from the regular readers
who will tell you to post within the guidelines.

I posted something similar to this in a different newsgroup, but I wonder if based on the logic that the interference could also affect other services such as emergency services, aircraft frequencies, and even military frequency allocations, it would seem to me to be important to persuade those groups to pressure the FCC against the whole BPL thing.....

I googled for the cost of a new one, on the day he first posted it.
Amazon.com will sell a new model for $675 and there was another dealer
(claimed to have it in stock) who would sell it for $649.

Since he probably bought it for a grand, with accessories, he probably
thinks that's a fair price and the fact that he's spamming a bizlion
people never even occurred to him. I'm sure he was one of the first to
sign up for the "Do Not Call" bill with the US Congress.

The transmission lines are radiators. As such they will also receive.

Power lines are right up next to the rigs. The RF from the radios will trash the BPL. Probably by causing drop outs and adding lots of extra delays. Basically it will make BPL useless anywhere near a ham station.

Personally, I only list items FA, FS, etc... in the rad.radio.swap newsgroup. It saves a lot of hassle. If someone is looking to buy something, they'll look there.

As far as people complaining about you selling other things in your auction, forget 'em. Ebay is much more worried about illegal amps and 10 meter radios than to worry about your auction. They're just playing Ebay Police.

I doubt that anyone sold a new SP3 for $499. That is way, way below
dealer cost. Probably a ColorMap which is a huge difference.

OK, let's say it does slow or even stop BPL near a ham station. Why
wouldn't the FCC restrict amatuer operations around BPL areas?

Be careful of which one you select, a street pilot is not a street
pilot. The newest one at a grand is the Streetpilot V, I think. I
don't remember ever seeing a 4, and the 3 is obsolete. I have one of
the originals, which I paid a bit for, but not new. It is more
convenient for the car, though.

3267. FS: GATES / HARRIS BC-1G 1KW AM Brodcast Transmitter

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-26 18:17:08 UTC
From: Larry <newsgroupreply*REMOVETHIS*@yahoo.com>
Message-ID: <3f747eed$1@katy-news.txucom.net>
Source record: 26588

FS: GATES / HARRIS BC-1G 1KW AM Brodcast Transmitter
For Sale - Harris / Gates BC-1G AM 1KW Broadcast transmitter. Located in Willis, TX 77378. Transmitter is complete with spare tubes currently on 1340 Khz. Was going to put it on 75 mtrs but it is too large for my shack. I have not fired this unit up yet but was told that it was working when removed from service in AZ 5 years ago. Unit is dusty and needs a good cleaning but very restorable. You must pick this unit up in Willis, TX if you want it. It is heavy around 1200 pounds. 936-890-9545 if interested. If no answer please leave message with return phone number. 73 - Larry - WD5CFJ

Hmmm. That would be real interesting. The FCC restricting the use of
lawfully licensed transmitters in order to accomodate Part15 unlicensed
operations of incidental radiators.....

Ed WB6SAT

3269. Icom SM-20 and FT-1000MP

Has anyone connected the Icom SM-20 Microphone to the Yaesu FT-1000MP MK V
Field and if yes how good or bad was the audio from this microphone.

Thanks

Andy

They'll modify the rules so it fits their agenda. remember, the FCC
will do anything that can make them $$$$ for the US Treasury.

Uh huh. The BPL folk have important freinds at the FCC. Do the hams? If
so, why has this BPL thing gone this far?

Well, hopefully, they can still read their own rules and regulations there at the FCC. You see we are the authorized legal service. And BPL is the unlicensed part 15 activity. Part 15 devices must accept interference from the licensed users. Hams.

Course again, we are dealing with lawyers. So anything goes.

In the words of John L. and Paul M. "I get by, with a little help from
my friends".

There have always been concerns about the incestuous relationships
between regulators and the industries they regulate. These concerns
have intensified during the current administration.

Foxes and henhouses.

Happy trails,
Gary (net.yogi.bear)

THEY are the law. If they decide the public need for this kind of
broadband internet access outweighs the need of a few hams to
chit-chat...well...

Politics is quite an interesting thing. What's Right isn't always
clear-cut, and doesn't always go, even if it is.

We're probably talking about a majority of lawmakers who neither
understand radio nor the internet. They're likely to see, "guy with
freaky-ass radio equipment is stopping hundreds of my voters from
getting internet access, and this should be illegal." Or, worse, "Guy
who is giving me no money is interfering with organization that is
laying on the dough."

A united voice speaks better to the government, which is why ARRL is
asking for backing.

OK. I did, and here it is:

S 97.121

(a) If the operation of an amateur station causes general interference to the reception of transmissions from stations operating in the domestic broadcast service when receivers of good engineering design, including adequate selectivity characteristics, are used to receive such transmissions, and this fact is made known to the amateur station licensee, the amateur station shall not be operated during the hours from 8.PM to 10:30PM local time, and on Sunday for the additional period from 10:30AM unti 1PM, local time, upon the frequency or frequencies used when the interference is created. (b) In general, such steps as may be necessary to minimize interference to stations operating in other services may be required after investigation by the FCC.

I don't see where the above applies to Internet service providers. They are not licensed stations, per se, anyway. You might also note how cable TV stations are dealt with under similar circumstances. They are always at fault if there is an RFI problem.

Message-ID: <Xns9402A3839C65CFrog207Junocom@148.78.248.75>
Source record: 26506

Remember how UPS made a big effort to persuade the FCC how they just HAD to have spectrum in the 220MHz Ham band? After a lot of arguing and legal wrangling, they got it.

Then, after they were awarded 2MHz of our 220MHz, remember how they determined that it didn't really suit their needs and they ended up in the 800MHz service anyway? (I believe commercial SSB systems were given the 220MHz portion for narrowband systems, which hasn't really worked out very well.....)

Regarding BPL.... I wonder if a similar thing might happen?

Ed

Get your facts straight. There are 300,000+ hams licensed to operate HF and another 300,000+ hams licensed in the VHF and higher only category. Note that BPL will also trash 6meters and 2meters.

Right now and under the new power level proposal, BPL must meet Part 15. This means that it legally cannot cause interference to any authorized or licensed radio service and must accept interference from any authorized or licensed radio service. Therefore any problems in BPL must be resolved on the BPL side under current regulations. It would require changes in both Part 15 and Part 97 to restrict operations around BPL areas. Plus don't forget the non-ham spectrum users. The FCC will have a heck of a time telling commercial AM radio, FM radio, and over-the-air TV broadcasters to shut down.

Actually there is some possibility that users who try BPL will dump it because the commercial broadcast systems (radio and TV), public service, etc will cause them problems and they'll decide to move to something else (back to phone, or to DSL, or cable modem and so on). There's quite a bit of RF floating around any city these days. It the urban areas don't use it, the rural areas will never get a chance to try it as it probably won't be uneconomical to set it up just for rural areas.

Spurious Noise/VHFRadioBuff:
Thank you for your replies. I'm sorry for adding to the garbage pile here; I previously had not read the posting guidelines for the rec.radio groups, and seeing all the for-sale and for-auction ads, thought it was a generally accepted practice to post them on the "equipment" group. Spurious Noise, thank you for the link to the guidelines article; hopefully I'll make wiser posting choices from now on.

Thanks!

Yes, that's the question. If a currently legal amatuer radio operator could
shut down high speed internet access for a given area, is there any reason
the FCC couldn't change it's current regulations, and put in new
restrictions on amateur radio?

I'm sure the FCC wouldn't restrict any of that. The TV networks, radio
networks and all the people who watch and listen won't let them.

Well interference caused by hams will be small potatoes compared to the
power that some of the commercial broadcasters are allowed to use. That
will compromise BPL over a much larger area than any ham station ever could.
If BPL ever comes to my area, I'm within a few hundred yards of some of

these broadcasters so the BPL users will never even notice my signal since they'll be constantly torn up by the commercial stuff.

I expect the BPLers would trap the broadcast frequencies. If the
interference from established broadcasters is still too high, they simply
won't offer service in that neighborhood.

But I don't think RF is the biggest problem for BPL. Overhead power lines
will only intercept a small percentage of the RF, and re-radiate at least
half of that. I think noise sources plugged directly into the power line
are going to cause far more problems.

Could very well be. If one of the neighbors has welding equipment, that can
really put a lot of noise onto an electrical line. It takes a lot of
filtering to keep that out of your radio and no doubt would do a good job of
interfering with the Internet signal.

Yep. Under current rules that matters. But if you read the fine print in
some of the petition and comments by BPL advocates, that's something
they'd like to see change. And if they can get such an idiotic scheme
as BPL past the Final Five, that little detail should pose as no real
show stopper....

I'm not sure that BPL will suffer so much at the hands of outside
interference. Remember, these are not analog systems, and will no

doubt be adaptive such that they can operate in noisy environments far better than any analog system. So while operating speeds may drop BPL may well go ahead and function acceptably sucnh that the end user won't realize it is being intefered with.

Do you have a model number available? The number you gave looks more like
a serial number.

wrote:

"To me", they can post a FA, FS, WTB, what every if it pertains to the
group in which it's posted.

They are at least as on topic as about 50% of the discussions,
probably more.

The groups have grown and changed as has the internet and Amateur
Radio.

Although the "market place is, or rather, *should* be the best, If
I'm reading the antennas group and some one has an antenna for sale,
or is looking for one, it seems a suitable forum to me. Besides they
are probably more likely to find some one interested than the people
going to the "market place". Although I keep that group and
occasionally visit, I am far more likely to see something of interest
is it's placed on the groups I read.

I say this never having posted a FS, or FA on any of the newsgroups as
far as I can remember.

Yeah, but.... TV is going High Definition and will be moving up out of
BPL range by the time it matters. AM BC is going digital and besides it
would be pretty easy to notch AM BC and FM BC bands out of BPL. Not so
easy to notch the several ham HF bands also and still keep BPL working
on track. And the notching might not be effective enough to work right
for hams.
I can't see assuming that the broadcasters won't make their own
deal and thus avoid their own confrontataions with the powers that be,
leaving the rest of us to swim alone in the shark-infested waters.

Our best hope is the opposition of other HF users- military, aviation, marine. Also the many low VHF users, some of whom are statewide police organizations, including the California and Missouri Highway Patrols. A few years ago there were several others. California has well over 5,000 mobile unit users and Missouri around 2000. That doesn't include base station nor repeater operations, which ups the count considerably and which would be even more adversely impacted. They can't move to a location away from the BPL noise as a mobile unit might.

Dick

Thank God Ebay was informed and you were stopped by the netcops.
Never know what kind of long lasting damage you could have done by
offering power cords. Some scumbags have nothing better to do with
their lives!

I gotta tell ya that through my many years of Ebaying, the only times
I've been ripped off were when I bought amateur radio equipment.
Maybe some of those self appointed netpigs need to do something about
them instead of a guy trying to make a few bucks legitimately.

Hello.
On my FT757GXmkI the VFO knob is a push-pull fit.
It is a very tight fit and I've on guarantee that all the mkI sets were a push-pull fit - Yaesu might have changed partway through production.

My 757 came with the "FT-757GX Technical Supplement" which shows how to take the set apart.

Looks like you remove the top and bottom covers and then you'll see the screws which retain the front panel.

I'm _almost_ certain that you don't have to remove the VFO knob in order to remove the front panel.
I think the front panel comes away from the body of the set as a compete unit.

I can scan the relevant page for you if that would help.

Hello OMs:

I am seeking some help from owners of FT1000(D) owners.

Please contact me if you are willing to provide me some resistance measurements around the PS (voltage regulator) Unit pcb. I need about 12 reference measurements to be made. Requires use of ohmmeter and removal of the radio's top cover.

eMail: wa.tworsx@verizon.net

I have just replaced the bridge diode rectifier (D9301) used for the regulated 30 volt section of the power supply. It is a $20.00 item from YAESU that I do not want to function as a fuse ! The resistance measurements are needed as a comparative reference before I power on the radio. If your measurements vary greatly from what I show here, then I must look deeper. Would appreciate help very much.

Thanks es 73,
de ~ Vince ~

> or I run the receiver off of AC power, all the SW bands are filled with
> S9 hash generated by the computer and network equipment.

The RX-320 arrived Thursday, I hooked it up to the PC and got nothing
but hash all over the bands. Then I looked at the ground my AC house
wiring is hooked to (it's about a 40 foot run of wire from the AC
entrance panel to the cold water pipe! Maybe it was technically compliant
with the NEC when the house was built but it wasn't worth crap...) and
decided I had to be able to do better. So I went to Home Depot,
invested about $10 in some 1/2" copper pipe, and drove several 5-foot
lengths near a handy window.

Using this ground makes a world of difference. All the nasty noise
went away. I learned my lesson!

Tim.

3321. First Portable

Newsgroup: rec.radio.amateur.equipment

Hi,

I'm looking to buy my first portable to jump in and get my feet wet. On top of world band I'd like to try to search out some pirate stations. I am thinking of the Sony ICF-SW7600GR. I realize this isn't high-end, but I don't know enough yet to spend more. I'd like a Drake R8B, but it ain't in the cards yet... :)

I guess I'm wondering how effective this radio will be for listening to pirates. I live in NYC on the top floor of a five story building and would be able to rig some sort of antenna on the roof. Or maybe get the Sony AN-LP1

Would this be a good starter radio? Any suggestions for an antenna? Any other recommendations for the uninitiated?

Thanks!

Jon

It has my sig, I don't know what the news reader did to the top.
There was no quoting, my post was the only thing there on mine.

Nice work. However it's not a good idea to have more than one ground
point for your domestic wiring. I suggest disconnecting the old copper
pipe ground wire near the circuit panel. You can leave the long wire in
place.

Uh, well, uh, but - you do realize that you're suggesting ungrounding the
entire house, don't you?

By code - if he did that - he should replace every 3-conductor outlet with
two-conductor outlets because the ground (green) has been removed from the
system (illegal as it can be, of course).

He did exactly as he should have.

He maintained the electrical ground ("earth") and he created an "antenna"
ground (chassis).

G7IZX - qth Runcorn , United kingdom

HI there .
I am looking for any info on the standard c710 tri-turbo handheld
A copy of the Manual in any format would be useful , and or review
mods , or info as to what mag and year / month the handheld was recieved etc

Photocopying expenses , are not a problem ,
hope to hear from you soon

de Paul

Hello Vince,
am surprised the diode bridge was taken out - there must be a dead
short AFTER it - have you checked the pass transistors - btw, send me
a circuit and I will try to fault find. What does it feed?

Looking to Sell/Swap the following:

Motorola Radius P-100 VHF Handheld - Model:H43QPU7120BN 2 Channel, DTMF Keypad, 150.8 through 162.0 MHz... Hi/Lo Power selectable from top-mounted toggle switch Currently on 151.680 and 158.755 MHz.. Good Cosmetic Condition - No engraving on case or battery - Paint Dots on top for power position (high), Channel (2) and Squelch Position (Speaker Off Icon) - With Screw-In Rubber Duck; also in good cosmetic condition.

Motorola Desk Top Drop- In Battery Charger Model:NTN4881B
Motorola Battery: 10V NiCad - Model: NTN5451B Battery does not hold a charge.

$50.00 plus shipping

****

Motorola Drop-In Charger: Standard Charger HTN9046B - 16 hour charge cycle. With Motorola Wall Wart Model ICC-6-375 - 18 VAC @ 1.8VA $20.00 Plus Shipping

****

(2) Regency Desktop Battery Chargers - Model: BC-45.... Output 12.8VDC @ 1 Amp MAX. With Charge and Ready Indicators - $25.00 each - Plus Shipping

****

(8) New Relm Replacement Antennas for Relm WHS-150 VHF Handheld. Approximately 6" Tall and 3/8" OD $10.00 each

****

(2) New BP007 Batteries for Relm WHS-150 - Still in plastic wrapping.. 10.8 VDC @ 700 mAh Nicad Battery. $26.00 each Plus Shipping

****

(1) Relm WHS-150 - 5 Watt - 16 Channel VHF Handheld transceiver, with belt clip and BP007 10.8 VDC @ 700 mAh Nicad Battery. With Programming Manual copy. Field Programmable. Scan, Priority, Tone Squelch, Hi/Lo power selectable, DTMF Keypad - With Wall wart charger (needs new wire and coaxial end. Charger works, and has sufficient pigtail to connect new charging cable. Battery seems to be good - holds a charge and lasts well under the moderate usage I have given it - coaxial jack inside battery is loose and has to be manually aligned before inserting charger plug. (I have been charging it with an old Alinco HT Charger). Mis-matched Volume and Squelch

knobs. Includes 3 new display panel trim pieces and 2 new Channel knobs. Perfect HT for those times when you want a Type Accepted rig that can go down to ham freqs, while still covering Marine VHF Band or VHF Business band needs. (See new batteries listed above). $150.00 Plus shipping

****

(1) GE "Spring Whip Antenna - 132 -174 MHz - NIB box with Cutting diagram for tuning to your frequency in this range. GE Part Number: 19B219888P1 $10.00 Plus Shipping

****

(2) Relm Model RFH252NB - 2 Channel VHF Mobiles. (tested at 20 to 22 Watts out on Bird 4304A) Currently on (radio 1) F1=154.370 MHz, F2=155.385 Mhz - (radio 2) F1=158.760 MHz, F2=155.805 MHz.. With Brackets, Power Cords and Mics and Manuals $45.00 Each Plus Shipping

****

(1) Relm RH256NB - 16 Channel - Keypad Programmable Mobile (Has problem in output - There are two 1 uH Chokes that are charred (Relm Part Number 1803-3268-210) - With Bracket - No Mic - With Instruction Manual and Copy of Programming Manual. $40.00 Plus Shipping

****

(2) Keypads for RH256NB Mobile - NOS repair Parts - $10.00 each Plus Shipping

****

(4) Relm Model SLV40 - 6 Channel 40 Watt VHF Mobile Transceivers - Programmable

2 are in the original box and packaging with New Power Cable, New Microphone, New Bracket, Manual, New Speaker (Radios do not match the serial number on box - look used, but in great shape and seem to be working properly.. $75.00 each Plus Shipping

On the other 2 :

1 has Mic, New Power Cable, Bracket, Manual - No Speaker $60.00 Plus Shipping

1 Has Bracket and Power cord only - No Mic, No Speaker, No Manual $45.00 Plus Shipping

****

(1) Relm SLU25 - 6 Channel - 25 Watt UHF Mobile Transceiver - Programmable - With used Bracket and Power Cable - No Manual, No Mic, No Speaker $55.00 Plus Shipping

****

(1) Relm Model SMV4099 - 99 Channel - 40 Watt VHF Mobile Transceiver with Instruction Manual - Programmable - Display has some segments out - New Display repair part included - $100.00 Plus Shipping

****

(7) Relm PT46B - Handheld UHF, 6 Channel, 4 Watt Transceivers with BP700 (7.2 VDC 700 mAh) Battery pack , Belt Clip and Antenna. $55.00 each Plus Shipping

****

(5) Relm PT46B - Handheld UHF, 6 Channel, 4 Watt Transceivers with Antenna - no battery, no belt clip... $35.00 each Plus Shipping

****

(8) Relm PT56B - Handheld VHF, 6 Channel, 5 Watt Transceivers with BP700 (7.2 VDC 700 mAh) Battery, Belt Clip and antennas - $50.00 each Plus Shipping

****

(6) NEW BP700 (7.2 VDC 700 mAh) Battery Packs - Still in original packaging $30.00 each Plus Shipping. (these will be offered with the 5 PT46B units that don't have batteries first, then made available as spares.

****

On the units that come with batteries - Most of the batteries are holding charge. Out of the lot of 18 used batteries; 2 wouldn't hold a charge, 3 didn't hold up to sustained use after the initial charge (I am cycling them now to see if that condition improves) and 1 had one of the plastic "slide rails" broken. I haven't tried to actually duplicate usage over a sustained time, but can confirm that none of the batteries have gone dead sitting after being charged in a 5 to 7 day period.

These HTs are programmable, hi/lo power switchable (mechanical), Tone squelch and , busy channel lockout options. All seem to work OK. Good overall cosmetic condition; some have IDs painted on them, non have any engraving on the case or batteries (that I have seen).

I have one (1) charger with the lot, and it will go when all are spoken for. It is a Relm Model BCS Battery Charger and it uses a wall wart that outputs 12 VDC @ 80mA. It is a drop in desktop base with detachable wall wart. Looks a lot like an old Icom charging base, but I am not sure of the contact positions being correct of the voltage requirements being the same..

I also have one of each that have bad internal Speakers. I have them patched with a temporary fix, but don't know how long it will last. They are available without battery or belt clip for $30.00 each Plus Shipping

When the smoke clears, I may have some extra belt clips for the ones that don't show them included..

****

BK Precision - Model 820 Capacitance Meter - Manual Ranging Capacitance Meter 4 Digit LED Display, 10 Ranges 999.9pF to 999.9 mF. Battery operated by 4 "C" cells - provisions for AC adapter operation, or for use with NiCad batteries. Capacitance meter only; no NiCads, Charger/AC Adapter or Manual. Seems to be in good operating condition. $50.00 shipped CONUS

****

BK Precision Model 1500 - 100 MHz - Quad Trace Oscilloscope with Instruction Manual, Schematic Diagrams and Parts Lists. Unsure of actual Vintage - Schematic and Parts book shows 1981 printing date. $150.00 plus shipping.. No Probes included

Features:

*Small and compact with high 5 mV/div sensitivity and 100 MHz bandwidth (1mV/div when X5 GAIN function is used and 500 uV/div for cascaded operation, CH1 to CH2).

*Bright 150 mm rectangular CRT with an internal graticle and a 16 kV accelerating potential.

*Vertical axis is capable of single, dual as well as 4-trace display.

*Dual sweep with independent A and B sweeps is provided in addition to single sweep. X10 magnification, delayed sweep and alternating sweep capability.

*Fast 20 ns/div sweep speed (2 ns/div with 10X magnification).

*A switching type power supply provides stable operation with varying power sources.

*A convenient channel 1 sampling output is provided.

*Gate signal outputs for both A Sweep and B Sweep are provided for use in synchronizing peripheral equipment to these sweeps.

*A convenient beam finder allows you to quickly locate elusive traces.

*Logic controlled switching and LED lighted push-button switches provides easy, reliable switching with setting hold capability when the instrument is switched off.

*Selectable 50-ohm termination for channels 1 and 2. No external terminations required when using 50-ohm input signals.

****

BK Precision Model 177/V-95 Vacuum Tube Voltmeter. With Instruction Manual and Parts List / Schematic Diagram. With BK Precision AV-2B High Voltage Probe. $40.00 plus shipping

****

BK Precision Model 283 3 1/2 digit - Digital Multimeter $45.00 Plus Shipping

****

BK Precision Model 2009 MTS TV-Stereo Generator - $45.00 Plus Shipping

****

Data Precision Model: 1455 - Bench Muiltimeter with AC or Rechargeable Battery Power options. Battery holding charge. $30.00 Plus Shipping

****

Data Precision Model: 258 Multimeter - Rechargeable - with leads and charger - Needs display $5.00 plus shipping

****

(8) AIM 15-5010 Coaxial Switches - Push button model designed for 2-75 OHM inputs to one TV Set Antenna system and cable system to one TV Set. 90 dB isolation. Push a button to change Signal Source. For VCR - CATV - MATV - TV - All "F" Connectors. In original plastic Bag with Double Sided Tape and Mounting Screws.. $5.50 Each Plus Shipping

****

ATV Research - Micro-Verter II RF Interface. Tuning Range Channels 7 - 10. Factory Set to Channel 7. Rear-Mounted "F" connectors for: Audio In, Video In, RF Out. 110 VAC Operated.. $35.00 Plus Shipping

****

ATV Research - Micro-Verter III Television Modulator. Factory Set to Channel 5. Front access to trim-pot based Level Controls for Audio, Subcarrier and Video. Rear-Mounted RCA Phono Jacks for Audio In and Video In - Rear-Mounted "F" connector for RF Out. 110 VAC Operated.. $50.00 Plus Shipping

****

Listing will be revised and updated as items are spoken for. Still have more to add... I will be taking a load to the Jacksonville, FL hamfest in October, listing on Newsgroups until then.. Thanks for reading

If these prices are not reasonable, please let me know, with a link to current pricing for these models in the used market.

Shipping to be paid by buyer. I will pack these items myself, so Shipping will be actual costs - or costs estimated from on-line calculator based on shipping weight and container size to your Zip Code. I will not be using a drop-off shipping depot, so shipping will be as reasonable as I can make it.

I can accept PayPal, money order, or personal check (personal check will delay shipping until check clears). I can provide references in the form of eBay feedback. I have been buying and selling in the newsgroups for at least 5 years; on CompuServe and fidonet for 5 years before that.

I would consider swapping for high-end Nextel cell-phones; Current models or late models that are clear for activation. Other consideration given for

good quality PDA and accessories that can be used for mobile data logging or data acquisition. Other electronic items considered for trade.

From you description, it doesn't look like you would be able to program
this to amateur or ham bands.

On the web, I've seen references to old-style and new-style Hi-Mound BK-100 bugs. There's a site in Japan that has photos, but the covers are on, so I can't be sure what the differences are..

Can someone give me a text description of the difference, please.

For sale:
I have a B&W BWD 1.8 to 30 MHz dipole antenna. This is the broadbanded folded dipole and has a 2.0:1 swr and less across the bands. Check it out at http://www.wb0w.com/bwantennas/bwdins.htm Its down on the ground and ready to go and prefer a pickup only. I will take $75 for it and have some digital shots of it on the ground if needed. I'm located in Lakeville, Ma. 35 miles south of Boston next to Taunton, Ma. ...WZ1U Steve

I think the only thing I can't program to Ham bands in this list (radio wise) is the Radius P-100 (Don't have the cable/Software) and the RH252 Relms (Don't have programming instructions. A sampling of all the others have been tested from 144 to 162 MHz. I think they will go higher and lower, but antennas and internals are optimized for 150 through 160 MHz, or there abouts.

It is nice to have a type accepted rig to use when you want to, and keep all the finger-pointing to a minimum.

Granted, the VHF rigs are only good for the 2m part of the Ham bands, and the UHF rigs are only good for the 70cm portion.

Yeah, that's what I did, and it worked very nicely. But it's also clear
that the ground at the AC entrance panel isn't doing so well itself. I've
got to find the relevant section of the NEC and figure out how I can
both comply with the code *and* put a ground there. I'm 100% sure that what
I did (5 foot copper pipes) for the radio ground isn't compliant for the
AC entrance ground.

Tim.

HI CHAPS
i tried to get mine off , many years ago .
their is not a grub screw any-where , it is simply a tight push fit
and glued on with some strong glue
and i never did manage to get mine off

But be warned i pulled mine so hard , when i tune now i can hear
a ticking , in the audio stages of the radio. , cos as you should know
it is optically connected , works simular to how a mouse works , if anyone
has
has one apart . i havent been able to get rid of the noise since .
a little anoying when tuning , as you have to stop to see if anyone is on
the
frequency

cheers de Paul

I feel BPL will make many adversaries among
the power companies themselves. Currently AEP
uses a regional grid monitoring system that
monitors the power line status in real time using
data over the power lines.

Should BPL interfere with the Utility Company's
Monitoring Hardware, BPL will be put into
the ash can.

Some examples of Electric Utility monitoring:

3351. YAESU FT-1000D HELP

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-28 23:04:11 UTC
From: Zeca <peixoto@ispwest.com>
Message-ID: <3F7768EB.6854221D@ispwest.com>
Source record: 26475

Hi all, I have a Yaesu FT-1000D. I removed the transistor Q3027 from the AF board and the odd thing is that I put a new one back in place the

same way the original one was. However, the flat side part of the transistor listed on the rest of the board is flat with flat, but with this particular one the transistor is opposite? Has anyone out there already replaced this transistor and which way is it suppose to be on the circuit board?
With headphones works fine but with the internal speaker half volume and

up the audio distorts and sometimes cuts out, but I just ordered the transistor and will replace it, but just wanted to now for sure which way it is suppose to be on the circuit board.

Thanks to everyone,

CMP

3352. How to improve reception

Newsgroup: rec.radio.amateur.equipment

I'm trying to get the Coast to Coast show, but because I'm in a highrise surrounded by concrete, I get no AM reception. I just get static and a hum. Can an antenna be hooked up to the radio that would end outside my window to pick up the signal? There is also a building on one side, but it is clear for quite a bit outside my window. Can anyone please help? Please also e-mail, if kind enough to respond. Thanks!

I have one of these and they GREATLY improve AM reception. Just beware,
if you are in a high noise area, it will increase the noise level also.

These devices are very simple to use. Just tune your AM radio to the
station you wish to listen to, set the Select-a-Tenna next to it, and
tune the Select-a-tenna until you get the best reception. You do not
need to hook the Select-a-tenna to the radio and it does not need any
batteries or electrical hookup, or any further adjustment, unless you
change the radio station.

3354. AH-4 vs ATAS-120 vs Screwdriver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-09-29 00:52:10 UTC
From: "Daniel C. Mckenzie" <mckenzie.no.crud@acegroup.cc>
Message-ID: <bl7vpk02e5s@enews1.newsguy.com>
Source record: 26479

Looking for opinions on the performance of these mobile antennas.
I'm planning on going mobile, looking at the FT-100 or IC-706, but
I'd like to go with something designed as a well organized system. So
I could go with the FT-100 / ATAS 120, or the IC-706 / AH-4, or
maybe either one with one of the various screwdrivers. I've heard that
the screwdrivers perform much better than either ATAS or AH-4.
What's your experience? Do the matched systems really work well?
Do you think a screwdriver with external controller or even manual
tuning would be much better? How about guying? I see that most
screwdriver antennas require guying but not the Yaesu or Icom.
Are there any web sites I can go to with real measured data, not
just anecdotal stories?

Thanks for your time!

Dan, W9FCC

An "upside down" transistor has, IIRC, very poor gain, but will work.

Try reversing the transistor, or better, go figure out which leads are
E B and C, and if you have an idea from the board or schematic, put
this one in the right position. If it's already that way, then I'd
go for another transistor.

IIRC, the reversed transistor has a lower saturation voltage...

Here are a few items for sale. Prices do not include shipping unless specified. I will ship overseas.

Swan WM-2000 Wattmeter.....$90 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is measured in 2 ranges: 0-200 watts and 0-2000 watts. This unit is in excellent condition and works well.

http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20002.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Also have a Swan 500C that I am parting. No knobs but nice front panel and lots of other parts

Thanks for looking,

I tune to local FM station for example 98.5 MHz, press 1GHz button which should turn that into 1098.5 MHz, but i still hear local FM station, just a little bit weaker (for 20 or more units). It appears lot of users have this problem. Did anyone found solution to this problem ?

It must be something with the filter, like it is not fully applied, or maybe not applied. Did anyone managed to fix it?

thanks

To be fair, the reactionary flavor of the 'netcops' is due to the @$$holes
who would flood the groups with constant 'For Sale' items, only to be
adverts to go to EBay to go look at their auction. Guys would flood
multiple groups, then give 'countdowns' to the auction expiration.

People were fed up and took a hard line attitude. And personally, I
agree with it.

You want netcops to police EBay? Do it yourself. You'll have your
work cut out for you!

Is there such a thing as a portable, affordable, two-way radio system with 10 mile coverage or better?

What about something that is slightly secure?

Here's the need that is driving this:

I can't really afford cell phone bills. I live near 5 families of relatives in South Carolina USA, each within 1 mile of me. Each morning and evening, I travel a long 40 mile road with no cell phone tower in sight -- zero coverage, even if I bought a cellphone. I would love to have a device that each of us keep in our cars, always turned on, as well as in our homes, and it would only provide communication among myself and my relatives. I would prefer to have something that could not be eavesdropped very easily, but I would take whatever I could get.

BTW, I don't know much about HAM radio, so please forgive my ignorance.

RE: Secure -- Well anytime you put something on the airways -- others can
tune in --- many with scanners hear all

Ham radio would require all parties to have a Ham License - don't think this
would work for you.
But all about obtaining a Ham Ticket at URL:
http://www.arrl.org/hamradio.html

The So Called "Personal Radio Services" are summarized at URL:
http://www.geocities.com/SiliconValley/Monitor/2254/radio2.html

Only thing that comes to mind is GMRS -- see URL:
http://wireless.fcc.gov/services/personal/generalmobile/
Pricey and you might have to build a repeater to get the range you want.

mike - get everyone licensed! study one day, then put the family in the
car, go to the local VEC test, get 26 questions out of 35 multiple-choice
questions correct, then go to Denny's and celebrate! a couple days later
everyone's license will appear in the FCC's ULS and you can set up a base
station and 2M comms in each car! doesn't have to cost a whole lot, either!

Yeah, that's what ham radio needs: more people with no clue what ham
radio is, no desire to use it for amateur, technological, dxing or
emergency service purposes, and whose only motivation is to save on
cellphones. There's already a band in place for such purpose and it's
called CB.

Leave the existing AC panel ground alone! Make sure that you tie your new ground to the existing power panel ground. Failure to do that can result in unnecessary damage in the event of a nearby lightning strike because the two separate grounds could be at vastly different potentials. The damage could be to your equipment or home. I'm sure your homeowner's insurance company would not look kindly at your having removed the power panel ground, resulting in damage to your home.

What is our goal? To preserve amateur radio for all the ideas that it
was originally established, enhanced with contemporary technological
features? Or is it growth at all cost?

If it is the latter, then why even bother with testing - let's simply
give away licenses on the street corner.

> Excuse me while I get back to my technological, dxing and emergency
> services work.

I entered amateur radio for the love of the hobby/service itself, for
experimenting, contesting and dxing. So did a majority of my ham radio
friends and acquaintances.

You, otoh, feel that ham radio can benefit from people who want to use
it only to talk to their grandmother and order a pizza.

As I said - there's already a perfect band for this and it's called CB.

Tim,

I would wait until you get your 320D. It comes with its own 15v wall wart (plug in DC power supply). This supply does not use the AC grounding pin. Mine has not caused a problem in this area.

However, time spent in planning the antenna instaliation will pay off. The built in active antenna will pick up RF hash from the switching power supply, metal case and all if the receiver is located near the computer. I use a simple long wire fed with about 15 ft. of 50 ohm coax, per the TT recomendations. The receiver then can be located on top of the computer if necessary.

If you have any problems give me a shout.

Bob

GoogleMike:
Amateur radio service would be great in an "ideal" world. However it is unrealistic to expect that everyone in your family will want to learn code or study the theory. (two entry level options). And unfortunately for the ham service, many in the ham ranks tend to turn off many potential hams. CB service is, well just awful and painful to monitor for days on end.

There is another such service that the family can enjoy without getting a "Ham" license. It is called GMRS, a private UHF FM radio service where up to 50 watts and repeater operation are permitted. Don't get this confused with low cost FRS/GMRS (FRS is family radio service), those units are low power and good only for a few miles. Check "google" for "GMRS, PRSG (Personal radio steering group) and other GMRS links and you will learn from what is available on the web. The last I checked there were over a dozen GMRS repeaters listed in the PRSG repeater guide (red book). Whether or not any of these are in operation is anyones guess. Check with PRSG for repeater operators in your area and see if any exist with coverage that will suffice for your locale. If not, you might want to install your own if you have access to mountain top property. At each house you install a "control station" with a yagi antenna so that all homes are linked to the repeater. With proper selection of frequency and squelch code, only those in your group will hear each other. But don't be mistaken, this is still radio, so someone with a scanner can tune you in. The advantage is that you won't have to listen to garbage on the channel beacause of the tone squelch code,

You can also search the FCC database for other GMRS users in your area. Unfortunately the FCC doesn't keep track of repeater installations anymore, but you can still seek out others in the community with such a system.

If the cost is out of your range, you can forgo the repeater idea and install base stations at each of your relatives houses, and rely on the limited range (a sort of cellular approach) and hope you don't get a flat tire in the dead spot between Billy Bob's house and Sally Mae's place.

Here are some basics:

Mobile radios $500-1200 new, (portables same range, but far less effective coverage)
Control or Base station, similar to mobile, add power supply $125 and yagi or omnidirectional antenna $100.
Repeater station $2500 to $9000 new (or cost share with a group)
Antenna tower for repeater or base station, $500 to $3000 and up depending on ... everything.

FCC License $75 for 5 years (covers entire family, even in the south)
Telephone interconnection - Not permitted
Secure, Encryption - Not permitted

If this won't work, your other choice is to hook up with a commercial land mobile repeater operator. Certainly someone in your area is providing coverage for joe the plumber. One hitch, these services are for business users, so keep that in mind for FCC license eligebility as well as when considering monthly expense.

Thank you very much for telling me what _I_ feel. I'll put you on my
speed dial so you'll be close at hand next time I think I might want
a feeling.

It's not my place to tell people how or why to use ham radio. As long
as they do it within the rules published by the FCC (NOT what YOU
think the rules should be), more power to them.

There's no question on the test that weeds out those who are obnoxious!!
Maybe there should be...
'nuff said!

If this is a Troll, I will give it the benefit of a doubt.
There is one way to get by as cheaply as possible. That way
is to get a pager and if relatives want to talk to you, they can
page you. And you may call them back using any public coin phone
near by. If none can afford a phone which is as secure as anything
unless its cordless then drive to their house/trailer etc. to visit.
If this is a troll, oh well, we need a little humor once in a while.

Is that right? Well, let's review these rules, shall we?

97.1 Basis and purpose

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

......

(4) Amateur service. A radiocommunication service for the purpose of self-training, intercommunication and technical investigations carried out by amateurs, that is, duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.

==========

I think that should do it. Now, let's review what the original poster's requirement was:

"I can't really afford cell phone bills. I live near 5 families of relatives in South Carolina USA, each within 1 mile of me. Each morning and evening, I travel a long 40 mile road with no cell phone tower in sight -- zero coverage, even if I bought a cellphone. I would love to have a device that each of us keep in our cars, always turned on, as well as in our homes, and it would only provide communication

among myself and my relatives. I would prefer to have something that could not be eavesdropped very easily, but I would take whatever I could get."

==========

Would you care to explain just how his communication requirements are in any way compatible with what amateur radio represents? Is amateur radio a substitute for a cellphone? Nope. Is it a communication system for a family? Nope. A private and exclusive radio band that outsiders could not monitor? Nope.

Therefore, in spite of all your arm waving and tap dancing, the recommendation for him to take a ham radio test is way off the wall, especially considering the fact that the man doesn't even know what it is *and* there is already a perfect band for his needs: CB or even FRS.

> There's no question on the test that weeds out those who are obnoxious!!
> Maybe there should be...

There's apparently no question on the test either that weeds out the people who would gladly turn amateur radio into a three ring circus just so we can have artificially inflated "numbers". Do you actually believe that guy would ever join the ARRL, for example? ARES? A local club? Anything? What possible benefit can the global amateur community have from such entrants?

I merely responded to your rant by suggesting that the ham radio
welcoming committee get a new spokesperson.

I never suggested that ham radio was the RIGHT solution to his problem.
And we all know that scrambling would not be legal. Someone already
pointed that out in a non-threatening manner.
BUT
The ham radio bands are open to anyone who can pass the test for any
legal and non-commercial purpose THEY (NOT YOU) see fit.

FWIW, I've been a ham for 40 years. I don't belong to ARRL, ARES, or a
local club. It's not MY primary objective to be of benefit to YOU!
But if you asked nice, I'd gladly help you with a specific issue.
I have CB and FRS radios.
I don't have a cellphone. I routinely contact friends via ham radio
and have conversations that do not relate to ANY of the points above.
The word "beer" comes up far more often than "emergency".
You want me to turn in my ham license?
mike
I do love a good troll.

No one has mentioned MURS. What is it....2 W or 5W. out or so? With decent antennas, a couple of watts out on 150 mhz will go aways. Heck, RatShak has some mobile MURS for what....$40 or so? Don't know about licensing requirements....google for MURS and license and see what comes up.

Of course, if you get the radio itch, DO study and take the amateur exam, and we'll welcome you to the hobby (well, at least most of us!) Fun hobby with benefits to the community, esp. when comms are most needed.

Hello all. My car has a seperate "accessory" port from the standard cigarette lighter. My understanding is that this port is actually rated for more amps than the cigarette lighter and might actually be ok to power my 50 watt 2m mobile if I were to add a cigarette lighter plug to the end of it.

Can anyone comment on this? Any experience using these accessory ports to power 50 watt radios? The car in question is a 2000 Mercury Sable.

They should give an Amp rating for the power port. It may be intended
for things like cell phones or laptops, which do not draw as much
power.

A typical 50W mobile will pull up to 15 A off 12 VDC at max power TX.

Most do not have this extra port, and do direct wiring from the
battery through the firewall, fused on both sides.

Happy trails,
Gary (net.yogi.bear)

Hi Andy,

Not a problem as long as you keep your power leads as short in length as possible.

If you have time you could run a pair of #6 fused from the battery into the car by following the hood release cable. That is what I did for my 1998 sable and truck. The anderson powerpoles are great connectors.

Here is a link for you http://www.eham.net/forums/MobileHam/934

Also http://www.eham.net is a great site for info and lots of elmers to help.

Thanks for the replies. I'm really trying avoid hooking the radio up to the battery. I've got it hooked up to the battery in my other car right now, but will be switching over to the Sable soon. I'll have to check the owner's manual to see if it says what the amp rating is for the Sable.

That's probably a little high for current drain. I would say it is
more typically 11 A. My IC-746 running 100-watts on 2-meters draws
only 18 A. Yes, I know you said, "up to."

My 50 W Yaesu rig specs 12 or 13 A.

I rounded up. No harm in a little safety factor, beside wire or outlet
ratings are always in multiples of 5 A.

Happy trails,

Hi Andy,

You will find that a separate, fused wire run to the vehicle battery is recommended by most sources (mfg., mags., etc.,). And indeed, it IS a good idea. Having said that, I've been running a 50 W rig (IC-2720H) from the rear seat accessory jack in my 2000 Saturn Wagon for the past year. Ran a single band 2M rig before that. Never had a problem with the rig or interferring with the Saturn's "brain". I would caution, however, against using under gauge wire. I'm using the rigs supplied power cord (I believe it's #12 stranded) for the run from the jack to the wheel well in the trunk where the rig is mounted. The control head is mounted on the dashboard. The rig feeds a MFJ dual-band on-glass antenna on the drivers side rear window, so the RF leads are away from the power leads and away from the front of the vehicle.

The draw for the rig is about 8 amps on hi power. That's with an antenna that's close to a 1:1 match. If it gets too far out of tune and your SWR's go up, the current drain will go up as well. So, set up the system properly, use wire at least as heavy as the lead to the accessory jack, and give it a try. Worst case...just run low power.

HTH,
Paul (N0KIA)

When I hear some of the people on 2 meters locally, I wonder just
exactly what is being advanced.

Considering, however, the restrictions on development, I wonder just
exactly what good this does.. How, for instance, is contesting
helping? Not the WAS or WAC, but the DX pileups...?

>
>(c) Encouragement and improvement of the amateur service through rules

Now this does happen, but working rare countries with a DX party is
probably not what they had in mind. And for that matter, the
frequencies from 50 on up are not too good at that... Perhaps we
ought to give them back?

I'm not sure that the ARRL is always to our benefit.

>ARES? A local club?

Possibly so, if there is one. He might just talk to some friendly
people who would get him interested in the hobby as a hobby. You
can't really tell. There might not be a local club, either.

>Anything? What possible benefit can the global amateur community have
>from such entrants?

Why does a person have to contribute to the global amateur community
to have a license?

How about

1) they buy equipment, keeping the manufacturers in business (what
happened to all of them, and why?)

2) He could join the pileup on a rare station and contribute to the
technology of hearing and understanding a pileup.

3) He could serve as an example of someone who has a ticket, uses a
ham rig, and perhaps enjoys it.

4) He could actually respond to an emergency in that 40 mile stretch.

5) He could respond to a weather net situation.

6) He might be interesting to talk to.

7) He and they might be able to provide some emergency communications.

8) They might enjoy themselves.

9) They might learn something.

The bottom line to me is that there are a lot of things done in
amateur radio that do not advance the state of the art, yet we do have
people out there who can help others as is needed, and have the
capability of doing the emergency stuff that is part of part 97.1

This kind of thing happens in more places than you might consider, and
has an analog in the "on topic" and "off topic" debates on some news
groups. I've seen the debates. I'd rather have off topic.

Yes, the CB craze was not too useful, and made 11 meters a bit of a joke. However, the theory exams (and perhaps the code, it could be debated) will keep out people who are not motivated.

I think that for the most part, the desire of the whole community that people obey the rules and have manners is probably more important than the tests. Even the tests do not keep out the idiots and fools. Can you say "porkbutt song"?

Fortunately, the number of these people is few..

Just some opinions.

Well, others already said that, but I have looked pratically
every board in the TS-450 and found no rubber compunds.
Indeed, now I know buch better my rig and I was amazed on how
well the parts are put and fixed and how it is easy to unmount
them.

What I found up to know is in another message.

>
>

That's right!
In fact I read again carefully the istruction manual, while
looking for the service one. I was so used to the disabled beep,
frankly annoying, that I didn't hear the error message!

First of all, I replaced the lithium battery, but this in fact
has nothing to do with the symptoms. Anyway, I put a battery
holder in place of the soldered contacts, thus in the future it
will be a 5 minutes work to change the battery. Apparently, I
didn't damage any cmos circuit...

Then, when I powered the rig, all parameters were of course
reset, so the beep was enabled and I noticed that when the

display became a row of dots, the speaker played "UL" in Morse code. This is the error message for "PLL unlocked".

I unmounted then the CAR board and opened the case of the PLL board, which is right under the CAR (and both under the speaker). I detached and attached again all connectors, to be sure it was not a bad contact.

Then I measured the 5V and 8V pratically everywhere and the voltages where there. Unfortunately I don't have a frequency meter with me now and the only I have was bought at an hamfest - never sure it worked well...
So I used an handheld, for higher frequencies, and another HF rig I have, for the lower ones. Using these radios as probes, I found that the VCO is probably working well: I tuned to 995 kHz and, since the first IF is at 73.050 MHz, the VCO should be at exactly 74 MHZ. And there I found it!
Moving the tuning to 1995 kHz of course moved the VCO to 75 MHz etc.

The PLL unit should also provide a fixed 64.220 MHz signal for the second IF, and this one was missing! No signal, or probably on a different frequency. This is the first real problem I have noticed.

Then I checked on the CAR unit the 8.375 MHz for the third IF and the 455 kHz for the sideband detector. Both were present, even if peraphs somewhat lower in frequency (I estimated 453 kHz). This could be the cause for the distorted reception in SSB.
Also the fixed 20 MHz signal was there.

So, what I need now is to know how to realign the PLL unit, to obtain again the 64.220 MHz signal that is missing (but for this I will also check again cables...).

Thanks for now to everybody.

I have also read the advice about sending the rig to a Kenwood service center. Well, this is the first thing I tried, but apparently it looks very complicated in my country to be serviced by Kenwood at the moment...

Why are you trying to avoid hooking direct to the battery? It is generally the best solution for a mobile rig. This minimizes the chance of things like alternator whine on the incoming or outgoing signal and any other type of interference that might be picked up by the car wiring system and delivered to your radio.

Maybe... who cares? Maybe, just maybe, if we gave away amateur radio
licenses on street corners, some of the new licensees would do all that
stuff that you mention. That is beside the point. He's not looking to
become a ham radio operator - he's looking for a cellphone substitute.
Ham radio ain't it.

> - of course, if i had run into you when i first started getting involved,
> i might, and i say just might, think that ham radio was populated
> with ignorant, cynical, sarcastic, unfriendly, non-elmering,

> un-educated losers?

I don't see where you get the idea that I am against newcomers and novices in ham radio (not to mention how you deduct that I am all that you mention). But this guy is neither a newcomer, nor a novice! He has no clue what amateur radio is and he's looking for a radio communication service that would replicate cellphones as the means of communication with his family EXCLUSIVELY. To recommend ham radio for this is ludicrous and ridiculous. Give it up already, you're wrong on this:

=== === ===
FCC rules: ï¿½97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

=== === ===

Is this clear now, once and for all?

>
> 73 (yea, right, like you mean it?)

Why wouldn't I mean it? Just because I disagree with you over what ham radio is or is supposed to be?

Oh, sweet mother of mercy! He doesn't. You guys are completely missing the point: the original poster was looking for a radio substitute for a cellphone so that he could talk to his family. That's it.

To recommend taking a ham radio test for this is ludicrous and ridiculous.

=== === ===
FCC rules: ï¿½97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

=== === ===

All else you wrote is irrelevant because he's not looking to become a ham to begin with. I can't believe I'm having this discussion. Would we be talking about all this if someone came in asking for a radio communication advice for his business? Would it be reasonable to offer him to take a ham radio test? If not, then why is this reasonable in the original example?

The screwdriver would get the nod in just about every case--particularly at
40 Meters and below. While I can't
point you in a particular direction on the spur of the moment, It is a known
fact that there is really no such thing as a "tuner". No matter what device
you use to "fool" the rig into thinking there is a resonant antenna out
there, there *really* is no substitute for a a resonant antenna. A properly
set up screwdriver will stomp on
a tuner or an ATAS and the ATAS would be simply because you are scrunching
the antenna down into a much smaller package. For the best results,
nothing beats
a BIG, UGLY antenna for HF--again where it concerns the lower bands. Of
course, I am sort of partial being that I make Screwdrivers (Carolina
Cyclone), but *I* would choose the SD and 706 combo. I also supply a
little tuning module with each antenna that allows you to
easily move your antenna coil into the right position. The
rig emits a tone and a 10-15 watt carrier. You then operate the screwdriver
motor up/down as needed to position your antenna correctly while observing
the SWR
on the 706's display. It is simple, quick, and beats the cost of those
auto-positioners all to pieces ($200 vs. about $15 for the module.)

Whatever antenna you choose, most people will agree that, while other
antennas can be quite satisfactory, no other antenna beats the SD or a large
center-loaded antenna. If you are satisfied with so-so performance, then
even hamsticks *work* (after a fashion). Me, I HATE a
puny HF mobile signal.

Hi, after almost 42 years I have renewed my interest in amateur radio. I am now 57 and am excited about getting into the hobby. I asked the same question in another (the other) newsgroup and got not much help, one asked how I found the group and why I asked this question there,,, not too friendly.... anyway..... If (when) I get my tech license, is there a band I can work voice that will cover some distance, not just local (I live in South Dakota) like other states or countries. When I asked this question in the other group, no one answered me. I looked at the arrl site and it doesn't give me much info on this. And..... what kind of a rig would anyone suggest I start out with, used is fine with me as I am not interested in spending a lot at this point..... and shoot me if you want to, I am not really interested in learning code. Well there it is in a nutshell, I hope someone can be of help to me,, Thank you all so much for your time in reading this, Gary Cooper

Fellow hams,
This upcoming February we will be holding a technician license preparation class. This class will be available (of course free of charge) to local CAP people, local sea cadetts, and any others wanting to obtain their no code technician class ham license. We held this class last year and helped prepare 16 out of 25 attendees to successfully complete their license test.

We would like to reward those who pass their test with a used copy of the ARRL handbook. If you have an extra copy of the handbook hanging around and would like to donate it, please drop me an e-mail at wn1b@k8uo.com. I will be willing to reimburse you for media rate postage.

Thanks for your consideration and 73. Scott, WN1B

<< I'm planning on going mobile, looking at the FT-100 or IC-706, but I'd like to go with something designed as a well organized system. So I could go with the FT-100 / ATAS 120, or the IC-706 / AH-4, or maybe either one with one of the various screwdrivers. >>

Dan-

The AH-4 is claimed to work from 40 to 6 Meters using a long whip. It may work mobile as advertised, but that isn't where its strength lies. In my opinion, it makes a better field day tuner, working into a random length long wire plus a good ground. I believe most of the other alternatives will outperform it while mobile, especially on 40 Meters!

I'm surprised you haven't received other comments supporting either Yaesu or Icom. I have never worked with the FT-100. Reports have been mixed, with some people being fanatic about it and a few needing repairs out of the box. Apparently its a great radio if you get a good one. On the other hand, I have read reports that its companion ATAS 120 may work, but is not exceptional in mobile performance.

Reports on the screwdriver antenna performance is generally good. A friend has a very solid one mounted on the rear of his pickup truck. There may be several different ones on the market, so look for one that is a little more substantial.

Although not as convenient as the automatic systems, the single-band antennas work fairly well mobile, at least as well as they can, since they are short compared to a full quarter wave. Examples are the HamStick and the Hustler. Also, the Hustler has an option-bracket used to mount several resonator coils at once, so you can work more than one band without changing.

$6K doesn't buy all that much in a military radio these days. A nice
current model Harris HF transceiver can run well over $30K. Some of
their VHF handheld and ï¿½low budgetï¿½ manpack radios are in the $6K range.

If it is indeed an accesory port as opposed to the actual dash cigarette lighter socket, possibly checking the actual wiring to the socket might give an idea as to the capabilities. Also, contacting the manufacturer of said vehicle could also help.

In general, the concept of the cigarette lighter plug is not a bad idea, PROVIDED that the wiring from the device requiring power and the wiring to the socket itself is more than adequate. For 12v related applications, it is too bad that this is not utlized more. Again, for those who want to read differently into this, I am saying the concept is a good idea, but current manufacture of such sockets are less than to be desired.

My next truck, I am going to wire quite a few of them in there, with adequate wiring, at least for the stuff requiring 15amps or less, with the source for those sockets coming from the battery direct.

The only band that will allow you to do this with a tech license is the
6m (50 MHz) band, but since this solar cycle is quickly going to the
dumps, you may have to wait a while for plentiful dx on that band.

If you are serious about working dx, you will have to bite the bullet
and pass at least the general license test. Abundant dx can only be
found on HF.

Here's the band plan:

http://www.arrl.org/FandES/field/regulations/Hambands_color.pdf

> And.............. what kind of a rig
> would anyone suggest I start out with, used is fine with me as I am not
> interested in spending a lot at this point.......

That depends entirely on which bands you intend to use.

> and shoot me if you want
> to, I am not really interested in learning code.

You don't have too many alternatives: either learn some code (it's
really not that difficult - it's been dumbed down to the point of
absurdity) or sit tight and wait for the FCC to eventually abolish the
code requirement for HF, like the increasing number of countries have
done lately.

Hi there!
I am a Newbie in amateur radio and I am on the way to build my
shack/antenna.
Question: Which SW-antenna should I take for good DX'ing?
Vertical/horizontal antenna, beam etc.
The problem is that I can't mount a 20 meter Versatower next to my house.
The only way is my roof which is about 6m from ground.
What is a really good HF-grounding? Is it enough to connect the antenna
mast/tower to the water pipe?
Lots of questions..... ;-)

Thanks
Mike

Supply and demand.... Apparently someone wants it. Not trying to be ignorant here, I've worked on one of these in the past.. they weren't bad but nothing to knock your socks off. In this day and age, $25 is the most I too would have offered due to the radios age. But, to each their own. I've paid a few bucks for some stuff too that others probably would have scoffed at. I'm sure the rest of you have as well. With one last thought, one reason why it MAY be fetching so much? Because it uses circuitry that most anyone can still repair. Not SMD. SO.... maybe they want it for ease of repair (providing parts are available). I know the next time I buy an H.F. rig it will be something vintage. I'm not real thrilled working on SMD. My eyes are not getting any stronger with age. I do it, but no one said I had to like it. My Kenwood TS 440 knock on wood still works.. But it would be a cold day in hell when I pay out that kind of cash again. Not when I can have a good HW101 or the likes. I loved their audio.

Good luck on the radio sale.

L.

Welcome back.

50 MHz (6 meters) has occasional "openings" which allow you to work long distance. However, these openings do not occur every day. Using SSB or better yet (gasp) Morse Code will be MUCH better for DX than FM. With a good antenna system and lots of patience, 144 MHz (2 meters) will occasionally allow relatively long distance contacts. This is mostly via Morse Code, however.

As far as a rig goes, well, that depends upon what you want to use it for. I'd suggest a used Icom 746.

I'd also suggest biting the bullet and passing the 5 WPM Morse Code test. If you really insist on not learned code, you can wait a bit until the FCC kills the code requirement -- which appears to be more than likely to happen within the next several years. (Note: That comment refers only to what is likely to happen and speaks neither for nor against code testing).

Why not wire in a bank of PowerPoles instead. Much neater and smaller installation. I use PowerPoles on everything now.

Dick - W6CCD

Gary,

Answers below...

"abr" <abr@iw.net> wrote in message
>If (when) I get my tech license, is there a band I
> can work voice that will cover some distance, not just local (I live in
> South Dakota) like other states or countries.

As other have stated, 6 meters (50mHz) is the best bet here/

>I looked at the arrl site and it
> doesn't give me much info on this.

Read it again. There is a wealth of information there. Might I also suggest
that
you invest in some additional reading, such as the ARRL's
"Now You're Talking" manual, which can be ordered on the ARRL site.

>I am not
> interested in spending a lot at this point.......

We all have that problem...

>and shoot me if you want
> to, I am not really interested in learning code.
> Gary Cooper
>
>

Gary, here's a problem: This question or a variant is asked almost
daily on the Amateur radio groups and sites. We are all running out
of enthusiasm.

There is a constant parade of "newbies" who want all the advantages that
come with an Amateur ticket, but they don't want to work for it.
This attitude is very evident in the text quoted above from your post.

Please do us and yourself a favor and research the service before you
ask us: "How can I get a ticket that would allow me to get on the best
ham bands without working/paying for it?"

The best things in life are worth working for. This will require some work
on your part, and not all the answers can be found on the internet.

Look for a local club that can assist with your efforts to become licensed.
This at least, has been made easier because of the internet. Then, attend
their classes, buy a book, and work for that ticket!

Believe me, it can be done, and you will appreciate the ticket more than if it was just given to you.

Sorry if my answer sounds unfriendly or harsh in any way, but it is at least realistic. After all, you would not show up at the local bowling alley wanting/expecting to bowl a 300 game without some practice would you? Would you show up at the softball field with no equipment or experience and expect to be allowed to hit one out of the park?

Of course not. Amateur radio is the same. You have to learn and build some skills before you can get the DX.

Hope to see you one the bands some day.

73, Gary WG7X

Gary -- getting out beyond line of site usually takes place on the HF bands
(code test needed at the moment)
Techs have privileges from 50 MHz up. Some of these upper bands will give
skip conditions -- but very very infrequently.
See 6m pages URL: http://www.uksmg.org/overview.htm

Until you pass the code test -- With a no-code Tech license -- there is a
way to talk to Hams around the world -- called VoIp -- includes IRLP and
EchoLink and others. However, the internet is the prime means of
communicating.
See URL: http://ac6v.com/repeaters.htm#IR

As for equipment -- lots of used stuff. For VHF/UHF a used handie talkie or
mobile unit can be had for $40+
Used HF gear like a Swan 350, Kenwood TS-520, Yaesu FT-101 will go for $200+
Antennas can be home made (homebrewed) -- URL:
http://ac6v.com/antprojects.htm

For equipment reviews -- see eHam URL:
http://www.eham.net/reviews/

For Swap pages and used price guide see URL:
http://ac6v.com/swap.htm

For radio photos -- see URL:
http://ac6v.com/techref.htm#photo

Good luck on the Exam and Ham Radio

This is a DRAKE version of the kilowatt low-pass filter,
well-built and heavy!
This low-pass filter was a staple on many, if not most,
of the ham stations of the 1960's and 1970's ---- and
will serve you well now, too!

Check it out !

Haha, love the trolling. FCC rules are outdated since the advent of cellphones.
The thing is, I cannot reasonably afford a cellphone, and ham radio, after the initial
expenditures,
is FREE, FREE, FREEEEEEEE (bar repair costs which shouldn't pop up unless you or the
manufacturer

screws up the equipment).
From what I hear about CB, its a garbage band where nobody can depend on consistent, unhampered
communications.
FRS? It's range is 1 mile AT BEST. Yes, I use FRS with privacy tones when appropriate.

But I'd rather set up a phone patch over 2m for any radio-telephone use away from home, if at all.

Just be aware that there is no software that will program in the subaudio tones for the repeaters. I am not sure but there may be some other things that can not be saved and programmed into the Icom by the computer interface.

BANG.. Now that you have been shot.. As others stated 6 meters will open
for DX. I have worked from NC to TExas and FL on 2 meters several times on
ssb in about 15 years. Running about 100 watts ssb to do it.

You might as well get an Icom 706 that has the low bands, 6 and 2 meters and
also the 430 to 450 mhz band in it and is all mode. Also you will need a
power supply of about 20 amps or more.

The code speed has been lowered to 5 wpm for the General and Extra class
license if you did not know that. Very easy test now.
It might be done away with all together soon as other countries have been
doing away with it.

You will need to be able to work the HF bands (i.e. shortwave) for this kind of communications. So you will need to get a General class ham license. This means that you will need to pass the Technician written, General written and a 5wpm Morse code test. The Technician license only requires a single written test but only gives you privileges on VHF and higher frequencies. These frequencies are more for local communications although under some unusual circumstances, VHF frequencies can travel great distances.

As far as a rig goes, it would be best to find some hams in your local area to advise you. Some probably have decent spare rigs that you could buy.

Also note that no one knows when it will happen. If you wait, you'll miss
many months or years of amateur radio activity.

Body handling: HTML body converted to readable text

Not at all. The question was, "Does anybody else think that van
is extremely cool?"

My response was "Probably every CBr that has seen it.."

The unit itself is enough to cause a wet dream for the
Mobile command center Operator, "WANABEE"

Bob

If you set up a phone patch, make darn sure it's protected against
unauthorized long distance calls.
I set one up and never used it. All the calls I wanted to make were to
order pizza or find out if some business had something in stock.
FCC wouldn't have appreciated those calls. Mr. Humbug from this thread
would have had an absolute hissy fit.
Point is, carefully examine the nature of your calls before going to the
hassle of putting up a phone patch.

??? That's it - I give up. If amateur radio, or at least its VHF portion has become a simple replacement for CB, then I know I made a right decision years ago to stick to HF only.

>> To recommend taking a ham radio test for this is ludicrous and
>> ridiculous.
>
> He was presented with several alternatives.
> How about you let HIM decide what's ridiculous!

WTF? We hams and the FCC will stand back and let him decide whether it is ridiculous to misuse our frequencies for his personal needs? This is not even trolling anymore - it's just fucking stupid.

>> === === ===
>> FCC rules: ï¿½97.113 Prohibited transmissions.

> I haven't had a radio conversation that couldn't have been handled by
> a cellphone...at least not since the cellphone was invented.
> I'd better go tear up my ham licence right now!!! Just for you...

This is a waste of time, but what the hell: a cellphone is not a "radio service". What ï¿½97.113 is about is preventing ham radio from being misused for radio-communication that is available elsewhere, like CB, commercial radio, broadcasting, etc. For his needs, CB is OK, ham radio is not. And that's according to the FCC rules.

The fact that I could just as well phone a VK or ZL station and give him a 59 over the cellphone does not mean that I am misusing my ham radio license, like you would have us believe. Otoh, your phone patch use for calling in a pizza and contacting dealers is clearly in breach of the

FCC rules. If you don't like the rules, bitch about them to the FCC, not me.

>> All else you wrote is irrelevant because he's not looking to become a
>> ham to begin with. I can't believe I'm having this discussion. Would
>> we be talking about all this if someone came in asking for a radio

>> the original example?
>
> I agree that it's mostly irrelevant to him. I'm bitchin' at YOU for
> telling him (and me) what we should and shouldn't do.

Again, since apparently you are mistaking me for the FCC: I didn't make the rules, the FCC did. If I'm "telling" you anything, it is only to stick to the rules, because acting otherwise makes us look like CB. If that appeals to you for whatever twisted reason, it certainly doesn't to me. I, for one, would like to keep our bands and service, which means sticking to the regulations, especially considering the constant pressure from the commercial users on our bands. However, if FCC should ever decide to reassign any of our VHF spectrum, people like you will make me realize that I have nothing to cry about - on the contrary.

> And 'cause I like a good troll.

There are funny trolls. There are interesting trolls. There are controversial trolls. They're sometimes fun to read. You are neither.

My MC-60 has bad RFI operating on 40 meters. I have done the usual jumpering of pins 7 & 8 (PTT gnd and mic gnd) but did not help. It only shows up when I touch a metal part on the mic. The best advice so far is to wear rubber surgical gloves to operate on 40. OH I did try the ferrite on the coiled cord. that did not help either.

<< In general, the concept of the cigarette lighter plug is not a bad idea, PROVIDED that the wiring from the device requiring power and the wiring to the socket itself is more than adequate. For 12v related applications, it is too bad that this is not utlized more. Again, for those who want to read differently into this, I am saying the concept is a good idea, but current manufacture of such sockets are less than to be desired. >>

Ryan-

I agree and disagree. I think it IS a bad idea. As you say, current manufacture of such sockets is such that it makes a poor connector for the currents involved.

While you may install sockets to meet your specifications, those installed by auto manufacturers often are limited by a ten ampere fuse, which means they were designed for a five ampere load. Many lighter plugs available on the market, may be adequate for five amperes, but not much more. I recall melting insulation on the wire to a lighter plug on a car I used to have, and the fuse never blew. The rig I was using only ran 25 watts output, but it had a problem!

I agree with the suggestion of Dick - W6CCD. I don't know if the Andersen Power Pole connectors are a perfect solution, but they are the best, most readily available mobile power connector I've come across. To test them out, I recently switched over to West Mountain Radio's smaller "Rig Runner" outlet box for mobile operation. They certainly are capable of greater current than a common lighter plug and socket combination. Of course you can bypass the Rig Runner if you only have one radio to connect. The genderless feature is one of the things I like about the Power Poles.

After using the Power Poles for a few months, the only drawbacks I've found are a difficulty in crimping ten guage wire, and the "roll pins" that some recommend to keep the connector pair from sliding apart, keep falling out. Per West Mountain's suggestion, I'm now using Super Glue to keep them from sliding apart, but I'm still looking for a good hand-operated open-terminal crimp tool for the ten guage connectors.

Hello, I have the following for sale:

1) Kenwood TMV7-A mobile dualband radio, which has also been modified
and is in mint condition, used only a couple of times. All accessories
included.
If you want more info on the radio, here is a link to Kenwood's web
site:
http://www.kenwood.net/products/index.cfm?AMA=open&ama_mob=open&radio=TM-V7A&selection=Ama
teur&ID=25

I am asking $300, which includes S/H via UPS ground anywhere in the
continental US.

2) Coment GP-9 dualband base station antenna. This antenna has NEVER
been used.
Here is a link to Comet's web site for more info:
http://www.cometantenna.com/base.html

Asking $125 for the antenna, which includes S/H via UPS ground in
the continental US.

If interested in any of the two items or if you have questions, please
email me at bearcat51@yahoo.com. Thanks!

That rule has been loosened up a bit. Contacting dealers is out but the
occasional use for personal items (ordering a pizza or rescheduling a
doctor's appointment) is ok if not done all the time.

But again, I am not asking about the CIGARETTE LIGHTER PLUG. I am asking about the ACCESSORY port in the car, which is supposed to be used to power "accessories", like inverters, computers, etc. I originally asked for anyone with actual experience with using 50w FM radios and the accessory port, but I guess I am the only ham in the world that reads this newsgroup that has wanted to try this.

If anyone has any factual information for me, preferably actual experience, please let me know!

The 2000 MY Saab 9.5 that I drive has a cigarette lighter and a rear
seat cigarette lighter. Since mine did not have the optional ashtrays
in it (interesting concept), it came with dummy plugs in place of the
lighter.

Total drain is limited to 240 watts for both plugs per the manual.

Your owners manual ought to tell you the limits for your car, if not,
then a good dealer should be able to. Worst case is prospecting the
fuse box to see what the fuses are. Most likely, it's paralleled with
the cigarette lighter socket.

I will have the HT powered and bypassing the cigarette lighter, but
the rear one will be running a little portable peltier junction
fridge, which takes a few amps.

Your only problem with the cigarette lighter may be that you pick up
more alternator whine than you'd like. That is one reason why people
suggest wiring directly across the battery, it serves as a big
capacitor.

Harvey

3462. Icom IC-V8 disassembly question...

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-02 15:59:01 UTC
From: achilles03@hotmail.com
Message-ID: <fef44ceb.0310020759.5cdf8d9@posting.google.com>
Source record: 26386

I'm trying to open the case of my IC-V8 to solder leads on the PTT button to control the TX via a remote switch, but I can't get the dang thing open. There's no more visible screws to remove, and it appears that it is attached via some unknown mechanism at the top (epoxy, snap features, etc?) Does anyone have experience opening one of these up?

Thanks in advance!
Dave

3463. Info Needed: Accu-Keyer

Newsgroup: rec.radio.amateur.equipment

I wouldn't bother.. I had one free with the IC-7400 that I bought.. It is a crap speaker, I prefer the sound from thr rig's internal speaker..

I might look at replacing the loudspeaker on my SP-21 it is that bad!..

3468. FA: AMECO PS-1 Power Supply - 125v DC / 6.3v DC

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-02 22:12:13 UTC
From: Dave <Dave@coldborst.org>
Message-ID: <ak8pnvo60evunbnijj7l3s6n7ikiookuoo@4ax.com>
Source record: 26392

Sorry to intrude with a commercial announcement but maybe one of my
fellow boatanchor enthusiasts can use this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3050552477&category=296&rd=1

AMECO PS-1 Power Supply - 125v DC / 6.3v DC

The PS-1 is a general purpose power supply for use with Ameco
Converters or other equipment. It supplies 125 volts DC @ 50ma and 6.3
volts AC at 2 amps. It may be used to supply power to 2 two tube
converters, 3 or 4 tube converters, crystal calibrators, VFO's, Grid
dip oscillators, pre-amps, Q-multipliers or other devices up to it's
maximum rating. The circuit is designed so that B+ or B- can be
grounded. This will permit operation as a negative bias supply, grid
block keying of transmitters, or the usual plate supply. The filament
is not grounded so as to permit the user to apply bias or center tap
connections that are often needed in preamplifiers or instruments. It
has an octal outlet with pins as follows:

1: no connection, 2: B-, 3: no connection, 4: internal tie point, 5:
ground to chassis, 6&7: 6.3v AC, 8: B+

As you can see from the pictures, the unit is quite clean and in good
condition. I tested it with a cheap digital multimeter and got 157
volts DC off pins 2 & 8 (no load) and 6.2 volts AC off pins 6 & 7 so
it seems to be ok.

3469. Re: Using car accessory ports to power radios?

Newsgroup: rec.radio.amateur.equipment

Source record: 26393

I have a 2002 Taurus, and there is a popout cover on the accessory jack that says "12V 10AMP." I couldn't find an exact reference to the amperage of the fuse for this circuit, though there was a 40 amp fuse protecting the power seat, adjustable pedals and "accessory". The lighter fuse is 20 amps.

I notice that on a lot of power supplies that have a lighter jack, the jack is only rated for 10 amps and the manuals say that they should be used for "accessories." The manufacturers recommend using the binding posts for transceivers.

If you do try this, let us know how it works out since this was my plan as well. The Yaesu FT-1500M allegedly draws 8 amps at 50 watt output.

Maybe someone can use this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3050522808&category=296&rd=1

This is a Heath EK-1 Volt - Ohm Meter that I acquired when I bought
all the equipment from a friends estate. It is in very good condition
with only some very minor surface scratches. The only testing I did
was to read the voltage from a 12 v storage battery. It read within
1/10th volt of my digital multimeter. I believe that it requires a C
or D cell inside to measure resistance. It comes with a set of leads
that have alligator clips on one end and banana plugs on the other

3473. Internet trials and the European EMC directive

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-02 23:45:23 UTC
From: Thierry <tlombry@hotmNOSPAMail.com>
Message-ID: <3f7cb893_2@news.vo.lu>
Source record: 26397

RFI from the power cabling system - Internet trials and the European EMC directive

Internet trials using the electricity power cabling sytem are currently undertaken in Austria, Belgium, France, Germany, Luxembourg and Switzerland among other european countries by private and national electricity companies.
Such trials are in violation of the european directive about the "electromagnetic compatibility" (ref. 92/31/EEC handling the famous CE logo) that states that "everybody has the right to use the frequencies at the condition to not bother the other users". However, it appears that these private or national companies are far to respect this law.
Amateur radio is a service that we pay yearly and as such, if we can not practice this activity we should have the right to require an exploitation losse.
Unfortunately neither our national representative ham associations (DARC, UBA, REF, RSGB, etc) nor the concerned IARU delegation can oppose to this criminal practice.
Ham associations have discussed about this problem in the offices of the European Commission at Brussels, but without to get the slightest action or result up to day...
Confronted to such laxities and to lobbies that are standing by, recently Hilary, alias G4JKS gave up his fight against administrations, hence the publication of this article that the author ask us to publish as often as possible on the Internet.

Thierry
ON4SKY, LX3SKY
http://www.astrosurf.com/lombry

The right technology for the right job, by Peter Cochrane,
http://www.silicon.com/petercochrane

This document is a reprint from a short article published on Silicon website in which the author reminded how can be hard the fight against administrations even when hams rights are derided.
Here are his commentaries.

For a decade now business plans have arrived on my desk, in increasing numbers each year, but only a small percentage find their way to commercial success. Remarkably I see very little correlation between plans.

There is, however, a major exception where the same plan seems to arrive on my desk every year. Each time it is presented as revolutionary and ground-breaking. But it is always the same technology and it is always as flawed and as misconceived as the original I first saw a decade ago.

News reports often included to amplify the case are along the following lines : XYZ Company is proud to report broadband internet trials are underway using a ground-breaking technology that will revolutionise radio, TV, cable TV, internet and data services to the home. Existing electricity power cable can supply all of your digital services at speeds up to 50 Mbits. Extensive laboratory trials have proven this technology, and testing with customers is at an early stage. If fully successful a commercial rollout is planned within the next three months.
It is then customary to include a CEO interview that says something along the lines of : "All the obstacles have been overcome. The technology is now proven, stable and economically viable, and we are in a position to revolutionise the last mile. We also predict this technology will see the demise of the telco in the next decade..."

Partner companies usually keep their names secret in anticipation of further announcements to be made later that year and the technical press always seem convinced it is all true. But about 6-12 months after the announcements the companies involved quietly say they are ceasing trials and development because some alternative technology has been discovered. It then goes very quiet and nothing more is heard.
I wouldn't find this so upsetting if it only happened once but to my knowledge there have been dozens of false dawns. If only the people involved would visit my office I could save them a small fortune. At a modest estimate, over $200m has been expended to date and no one has been successful in transmitting significant amounts of data over power cables to the home.

I can guarantee no one will get this technology to work as advertised. It might be appealing and economically attractive but I'm afraid the basic laws of physics cannot be sidelined. For anyone contemplating the waste of another $5-30m here is my 'don't do it' shortlist:
- Power cables employ low-grade plastic that is unfriendly to high-frequency signals as the absorption per unit length is very high. This alone precludes transmission of high-speed data over significant distances.
- Power cables are not physically symmetrical and are therefore very effective antennas. They radiate energy from high-speed data signals which becomes a source of interference for wireless services including broadcast radio as well as emergency, maritime, aeronautical, military and navigation services. By reciprocity they also suck in energy from every local radio source which further degrades data signals.
- As signals propagate along cables they become weaker but the switching transients from washings machines, refrigerators, vacuum cleaners, electric drills, light switches and other appliances are huge, do not decay at the same rate and swamp data signals.
- Switching transients on power grids with generators going on and off line, dynamic load sharing, fault and maintenance work, all induces massive transients that also swamp data signals.
- Cable joints, transformers, power meters, the on/off nature of electrical appliances and the topology of power grids create large load changes and multiple signal reflection points. This creates a dynamic echo environment where the transmitted signal is further corrupted.

- Real time communications of any kind - whether by telephone, radio or TV - are taken out by the huge voltage transients inherent to power lines and ultimately the data rates achievable for non-real time are also very low.
- Transformers and power meters require a workaround as they present an absolute block to any high frequency signals.

This is a short disaster list that says this technology will not work. And the real nail in the coffin? Telephone and cables were designed to carry far higher frequencies than 50Hz power cables and in every aspect offer superior performance for all data applications. And more recently wireless technology is becoming so low cost and so high performance that signal processing requirements for data over power cables, even if it were possible, would be prohibitively expensive in comparison.

In many locations the power companies have installed optical fibre along their power lines for telemetry related to the control of power distribution. Because their data requirements are so meagre huge amounts of bandwidth are available. So it does make sense for wireless technology to be used at that end point, in a distribution mode to attack the last mile. Despite all of this there are more than 20 power companies currently active across Europe planning or conducting trials. The reported field performance results are very poor, as expected! Installation costs are higher than the telcos and cablecos. Yet they still seem determined to become the biggest source of radio interference on the planet.

And the ultimate decider? It looks as though the politicians will be asked to decide between the power and wireless lobbies on the legality of the interference levels.

Contrary to a widely held belief, all the technology necessary to transform the local loop is to hand, and sporadic solutions such as data over powerline are a bit of an economically driven red herring.

So please, will the next candidate thinking of sending me another business plan with a revolutionary technology that will exploit power cables please employ someone who understands Maxwell's equations, data transmission and holistic economics.

This column was compiled in a hotel lobby between meetings and despatched via a Wi-Fi link that appeared without identification - thanks to whoever decided to provide this charitable service.

I used a cigarette lighter plug on my IC-2100 for a week. Turns out that
I melted the solder in the fuse due to excessive heat. A small amount of
resistance times the current makes watts of heat that has no place to go.

I cannibalized my CB power circuit for ham use. Now it works better.
(6 gauge to battery. I used to run heat.)

In my Chevy van, the owner's manual rates the cigarette lighter at 20
amps, the accessory power outlets at 25 amps. Check your owner's
manual -- it should give you a maximum rating under something like
"accessory power outlets" or whatever.

Then check your transceiver manual, and see how many amps the rig
pulls at 50 watts fm...

Finally, you can just try it, and see if the plug gets warm or hot...

And thats why I wouldn't run more that it is rated for, for the factory
ones. Running low current draw devices is not a problem with those factory
designed ones, unless they are specifically designed to run a higher draw.

Trying locating one of the grommets on the firewall and feed a fairly decent
wire (two conductor wire) to the battery that way. No damage if you are
using an existing source entry point. Works well especially for those
leasing a vehicle.
If it is large enough, you might also be able to run other devices as well.

Over there in USA, the hobby seems to be all about money, while here
the value is not neccessary the same as what you pay. If few persons
bits on it you may get it for much less than it is worth

I receive a lot of nuissance offers for items on my site, it seems
needless to say that it is a hobby, not a business

I am posting on behalf of a friend, KB9JRZ. He has a Kenwood TM-V7A.
The dual-band mobile they came out with that has the blue screen. His
screen has progressively gotten worse to the point of not being able to read
the freq anymore. What checking he has done with retail stores says they
can not get one. Surely somewhere a new face/display can be found right?
Any help will be appreciated, you can respond here or to my e-mail, less the
NOSPAM of course.
Thanks, KB9LTJ

3484. Change the SSB power ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-03 20:28:03 UTC
From: Thierry <tlombry@hotmNOSPAMail.com>
Message-ID: <3f7ddbcf$1_1@news.vo.lu>
Source record: 26305

Hi,

If you have an external wattmeter connected to your transmitter, can you make a test at 100 Watts PEP and give me your true emitting power in watts ?

Speaking normally (without shouting) in their mike with normal compression (10 over 25), some hams say that their wattmeter displays a power of about 50-60 watts (of course in CW they reach 100 W)
But some arrive to move the niddle to about 100 watts in SSB using their barefoot RTX...

It seems that some RTX can reach the nominal power doing a hardware modification at the mike itself to increase the 60 w displayed in SSB to about 100W. According these hams there is no disadvantage to make this change.

The problem mainly occurs of the Kenwood TS-570D (all the serie in fact) using a handy mic or even a desk model (the ones sold by Kenwood).
The same problem occurs with the Yaesu 1000 MP (tested at 100 W).

If such a modification exists for that TS570D or for any mic, can a ham do it himself or can he ask his dealer to make the modificationcan
Where on the Internet can we find this procedure ?

Thanks in advance

Thierry

You've all seen those tiny VHF/UHF magmounts at hamfests...usually black,
and
resemble a cellular antenna?? The magnet is about the diameter of a quarter
(never fell off though!!)
They are complete with thin RG174 coax.
Any idea what the power handling capacity of these jobs are??
Would a 50 watt rig melt it?
How 'bout 35?
Just curious...before I smoke test it!!
Thanks for your thoughts
...Dave

The Iron Horse IHMM270 dual-band mini mag mount antenna seems to be
rated for 50 watts on 2-meters, and 25 watts on 70 cm.

This is nonsense, Thierry. If you shout loud enough into the microphone, of course you'll notice a higher power reading on the wattmeter, but so what? SSB transceiver should be adjusted so that the reading on the ALC scale stays within limits. Anything else is overmodulating and causing splatter.

> It seems that some RTX can reach the nominal power doing a hardware

There is an audio booster circuit, which is actually a dynamic compressor and it works by increasing the level of the softer portions of your speech while keeping the louder portion the same (hence dynamic compression). If properly adjusted, it may give you some signal boost. The drawback is that the other side will be able to hear a mosquito fart in your shack if the signal is good.

Then there's a high audio booster, which increases the higher frequency portion of your speech, but this is generally included in modern rigs.

If your mike can drive your Kenwood's ALC to the limit when speaking normally, there is nothing wrong with it. Build a better antenna instead of wasting time on CB-like schemes.

Source record: 26318

<< I'm looking for a schematic, or at least hookup information for the Accu-Keyer. >>

Mike-

The original article was in QST magazine, written by WB4VVF from the Orlando, Florida, area. I understand he still lives in the area. According to the QRZ data base,

WB4VVF
JAMES M GARRETT
1141 KILLAWE TER
CHULUOTA FL 32766

If you don't find what you're looking for, you might write Jim directly.

I also have an AccuKeyer, but don't have any idea where the documentation is. As I recall, the original design was intended to key a vacuum tube transmitter with grid-block keying. It is supposed to work with the more modern solid state rigs as well, but sometimes the offset voltage of about 0.7 volts, is too much. I modified mine by removing the high voltage PNP keying transistor, and used the NPN transistor of the preceding stage to key my rig.

I don't have any documentation handy, but I'd be willing to look into mine if you have specific questions.

I have a new in the box Sony ICF-2010 for sale.
I am the original owner. The radio was in a dealers stock, and was dead out of the box. The dealer returned it to Sony and it was fixed. I stumbled upon the rig, as it arrived at the dealer, from Sony. Needless to say, I bought it right away.
Serial # 364401. the radio is in as new condition, all assys are as new & never used or taken out of their package. I've only applied power to the rig to make sure all functions are working. (I prefer my Grundig Satellit 700, better audio)
I've had the rig sitting around the shack and I don't use it. Figure it is time to let it go.
No trades please. Price: Best Offer, shoot me an E-mail. I'll contact the highest bidder. Rig will ONLY be shipped by US Priority Insured mailing.
References available, I've sold some of my surplus gear on this site, & on Ebay.
Questions, just ask.
Thanks,
Nick

<< But again, I am not asking about the CIGARETTE LIGHTER PLUG. I am asking about
the ACCESSORY port in the car, which is supposed to be used to power
"accessories", like inverters, computers, etc. >>

Andy-

I had assumed that the accessory port used the common lighter sockets as power connectors. If that is not true, perhaps they use a connector that would be better for general high current use. Please elaborate.

If it does use lighter sockets, that was the basis for my suggestion to use something different where more than 4 or 5 amps of current is involved. Yes, that would result in "hamifying" your vehicle, but it would provide the capability for higher current equipment.

You mention inverters being used with the accessory port. A common inverter would be one like Radio Shack's 300 watt unit. Fully loaded, it might draw about 25 Amps. Although your accessory port may be rated for more than 25 Amps total, I don't think it is a good idea to draw that much out of any one lighter socket connector.

Source record: 26325

Hi,
You partly right but this is well what I said in my post. The problem I speak about is completely different.
As usual your comments are out of subject and from what I read you don't even know the problem trying to compare wmy request to "CB". ! It is a pity that an ham has a so bad ham spirit....

The reason I don' have 100W on SSB is due to the audio limiter so by bypassing it I can get 100 w whatever your (false) opinion in that matter. This is nothing to do with the compressor...

An accessory plug can bypass audio and therefore left the mic connector unchanged so I can either use the TS570D in the standard way or connect a mic to the accessory plug and operate full power SSB.

The mod is relatively simple and requires a jumber and the removal of 3 or 4 smt components.
Of course this is not thanks to you that I had this information that may interest others hams. Others did hopefully.

Question for Thierry: Can I assume you have a "Peak" reading wattmeter? Otherwise, you are aware, I hope, that most wattmeters are "average" power reading and that they can not display the peak readings of a SSB transmitted signal.... thus they will never display close to the 100watts of a 100watt rated SSB signal; unless you are modulating the transmitter with a test tone audio source.

3504. Elecraft K2/100 pre-purchase questions

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-04 22:05:09 UTC
From: ps <ps@localhost.invalid>
Message-ID: <vnugpkq06bds6d@corp.supernews.com>
Source record: 26327

I've just started to shop for my first transceiver and Elecraft K2/100 looks very good. My first radio was a heathkit sw built in the early 60's, and I have good electronics assembly skills/tools -- so building not a problem.

Questions:

1. I can't find much info on frequency drift. How is it in your experience?

2. how well does the ssb option work? If its not a full speech processor, is this an issue?

3505. Re: Using car accessory ports to power radios?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-04 22:48:27 UTC
From: Dick <rhughes33@cableone.net>

Source record: 26328

I think the most important thing here is to find out what your
particular vehicle shows in the specifications for those accessory
ports. There are obvious differences between vehicles. Our 2003
Honda Accord, for example, has two accessory sockets and no cigarette
lighter socket. They can each provide 10-amps (120 watts), but not
simultaneously. The total power between the two is still 120 watts,
so they are obviously on the same circuit. We would have to have the
owner's manual to your vehicle to answer your question.

I'd be calling limited people and emergency agencies, but not businesses. I'd block out 900 numbers
and any number with an area code that isn't 619/858/760 since those are the three San Diego County
area codes. Hopefully I could do that.

Oh, my, god. The U.S. is becoming the Iraqi equivalent of Radio Shack. You want economy? We'll give
you extremely expensive but nearly worthless electronics because they're so complicated you won't be
able to use it. Oh, and the manuals will all be written in english too. Oh, and you'll need us to

help you get enough electricity so you can charge the NICAD batteries. But nooooo, no solar power
allowed. That would be too smart, and we can't have that.

Why does Iraq need a radio system better than Orange County, CA police (digital trunking encrypted)?
Jeez. Bush needs to start focusing on helping his own damn country rather than destroying and
rebuilding the rest of the world at our expense.

I strongly advise you power it up and make sure it works fully before you try to sell it. Any good
electronics tech will tell you that it takes just a few months for unused equipment to die and need
reconditioning or to be tossed out. With 18 months of idle time, the chances are greater that it has
died from unuse. This advice was given to me from KF6BQF, who has been fixing electronics for over
30 years.

I called Kenwood and explained that since this is a known problem with the TM-V7A I would expect a little help with the repair. They told me to send it in and they would fix it for free. It was three years after the warranty expired. I was told by the person who answered the phone that this is a know issue and Kenwood would repair it for free if I sent the head unit in with the serial number. I sent it in on Wednesday and received it the following Wednesday. All things considered I thought that was outstanding. I was out only shipping one way. I hope it will work out as well in your situation.

>better for general high current use. Please elaborate.

The accessory port I am refering to is seperate from the cigarette lighter. As
a matter of fact, the owner's manual says not to use the cigarette lighter plug
for anything other than the cigarette lighter. There is no rating in the book
or on the cap for the accessory port that tells the max amps that can be drawn.
It looks like I'll have to run wires to the battery after all.

In the manual it should say what fuse covers what circuit, and what it's
amperage is. My guess is your acc. port is a 20A circuit.

> even know the problem trying to compare wmy request to "CB". ! It is a pity
> that an ham has a so bad ham spirit....

The real pity is in the fact that a ham has such a piss-poor understanding of how SSB modulation works. Furthermore, if you want to talk "out of subject", perhaps you might want to check your own messages on rec.radio.* forums. Also, if you choose to interpret replies to your messages that don't kiss your ass as "bad ham spirit", that's your prerogative. Now back to the topic:

> The reason I don' have 100W on SSB is due to the audio limiter so by
> bypassing it I can get 100 w whatever your (false) opinion in that matter.
> This is nothing to do with the compressor...

This is a complete bullshit. How do you know you don't have 100W on SSB? Have you used an accurate laboratory standard peak-reading wattmeter? Do you understand the nature of the SSB voice modulation? It is unrealistic to expect that your general purpose amateur radio wattmeter will indicate 100W during a normal SSB transmission. Just a reminder: an SSB voice transmission transmits a modulated signal that has a dynamic response of 20-30 dB, which means that the peak power of plosives will be fairly close to 100W while fricatives, nasals and vowels will produce anywhere from 0.1W to 100W, depending on your speech (which, in turn, depends on the language, sex, physiognomy and many other individual factors).
You want us to believe that although Kenwood provides a technical specification for its transceivers (TS-570 included) that claims 100W output on all amateur bands and in CW, SSB, FM and FSK modes, they fail to deliver on this specification because they employ an "audio limiter", so the way to get full power out of the rig is to bypass this circuit???

> An accessory plug can bypass audio and therefore left the mic connector
> unchanged so I can either use the TS570D in the standard way or connect a
> mic to the accessory plug and operate full power SSB.

In other words, you can use an accessory DIN connector in the back to input audio instead of going through the mike plug. The problem is that this input goes to the same spot as the mike audio input. But, wait, here's a magic solution:

> The mod is relatively simple and requires a jumber and the removal of 3 or 4
> smt components.
> Of course this is not thanks to you that I had this information that may
> interest others hams. Others did hopefully.

And here we go, just what I was talking about when I said you were wasting time on CB-like schemes - that band is full of "experts" who "increase" their power by employing all kinds of charlatan mumbo-jumbo techniques, from audio boosters to magical 30 dB gain antennas. The results are obvious for anyone who ever bothered to listen to that shit when they illegally encroach on our 10 meter band.

Now you come along and make an ass of yourself first by completely misunderstanding how SSB power is measured, then by modifying a properly functioning rig with what can only be interpreted as a mod to eliminate the ALC circuitry. The result will be your signal splattered all over the bands and an increase in TVI.
Last, but not least, even if what I said was completely untrue, even if you were able to magically "increase" your SSB power from, say 70W to 100W, this increase in power would result in the astoundingly lame 1.5 dB!!! And this at the expense of splattering the bands?

I told you once and I'll tell you again: build a better antenna instead of wasting time on CB-like schemes.

Hi Ed,

Yes for sure. But I think that it rather displays the "instantaneous"
modulation not an average because when I shout at the mic or using the key
the nidddle reaches immediately the maximum without delay and speaking
normally I emit about 40-60 watts only, moving up and down at the rate of my
words.

This is not really a "problem" of power or with the microphone or even with
the compression level, because Kenwood made some tests for me and confirmed
that hardware speaking the emitter and the microphone were OK, whatever the
mode, see my EXCEL sheet with power measurements,
http://www.astrosurf.com/lombry/qsl-ts570-3.htm (end first screen).

But comparing to others TX (i.e. TS440S) there is a huge difference when
speaking at the mic.
My TS570D and Yaesu 1000MP (reduced at 100W) give about 60W instead of 100W
in SSB speaking normally, conversely to TS440S and many olders that give all
their full power, without having made any modification on the RTX.

I have not tested many rigs, but it seems that the audio of olders models
(made 20 years ago) was manufactured differently from the new one (last 5
years), may be is this justify to protect a relay or another component, I
don't know.
But the problem is that I bough a 100W emitter and not a 60W...

I will soon get the modification to make using the accessory plug in order
to not modify the mic itself.

Thierry

PS. And for those who wonder why I do not do "CB" (??) or buy a beam, I
already use a 4 ele beam... and sorry for the ones that confuse ham and CB,
I do not share at all any passion for the 11m like them.

> and the resulting distortion.

Hi,

The few OM knowing the problem and how to solve it, have not speak yet about distorsion of any kind.
They compared the TS570D with a TS440S that give well all its 100W in SSB. The second produce not QRM at all and work really fine (over 290 DXCC in about 4 years without the slightest comment about a bad modulation, QRM or whatever...

In all cases if there is any risk to blow out a component or to create QRM or anything else, then indeed I don't really see the advantage of this modification. But this is too early to conclude and give an opinion.

I am waiting the full explanation about this mod and about its "side-effects". If you are interested in I will post another message as soon as I get it.

Sorry it was not a 440S but well a TS840S.

The K2 doesn't drift, usually.

As for the SSB, I have only used a K2 in CW mode.

There is a Elecraft reflector available from the website at www.elecraft.com
but keep in mind, the folks there are usually very happy elecraft customers.

I personally do not have a K2, but I have a 4 band K1 that I use almost
daily with no issues at all. The QRP group I belong to usually has two or
three K2s on the air during Field Day and they work very very well.

I know they have sold thousands of the K2 rigs and I really haven't heard
much in the grumbling department about their function. Pretty solid rig.

I just acquired a K2 built by someone else and have begun evaluating it for my station. Having built and used many Heathkits over the years, I can say that there's no comparison between the K2 and Heathkits. I've noticed no drift whatsoever. The SSB option works perfectly, but I've not yet gotten into the speech processor option, so can't comment there. The flexibility and performance of the variable crystal filter is quite remarkable on all modes, and gives you the equivalent of a few hundred dollars worth of filters in the traditional HF rig. The K2 is definitely not a kit project for the beginner. For an experienced ham however, it's a rig that you'll likely NEVER have to ship off for alignment and/or repairs because of the very serviceable design and the support available from the manufacturer and the Elecraft reflector.

<< How did the 831mW on certification submission turn into 2,000mW on manual and package? >>

JerC-

They lied!

My guess is that if challenged in court, they might claim that the higher power was either

a) The result of using the car battery to power the radio instead of its internal batteries,

or

b) The total power delivered by the batteries.

The case for (a) is based on power output being greatly affected by DC voltage. A slight increase in voltage sometimes results in a higher percentage increase in output power.

The case for (b) is based on FCC limits, which would likely be exceeded by (a).

I doubt that Walmart cares, but you could use this information to justify a refund after their normal return period has expired.

> I don't recall ever seeing 100W on SSB with my TS-430, TS-440 or TS-570
> when speaking, a steady tone will do it of course.

Hi,

This is the first time that we note this problem too and the problem was
detected by chance... :-((
All users are exprimented OM some for decades and never observe this
effect... All told me that indeed their TX cannot emit its full power in SSB
but rather 50-60% in speaking normally. So we were very surprised than one
of us could reach the full power...

Our friend used a TS-840S and some olders and show us at the radioclub what
the matter with its TX.
He nearly reaches and sometimes exceed the 100W...in SSB, something we even
can't get using a yaesu 1000 MP of the last generation !

So as he recently bought the new TS570D he immediately noticed the
difference. Even using an electret microphone (using a battery and known to
boost emissions much more than a dynamic one) he cannot get the full power
of its older TX. Therefore we did some complementary measurements and have
searched for some information. Hence this post and some others

So at first sight I suspected an error in its reading procedure, etc. But
not at all...
Someone having read my TS570D review on Internet explained me that he knew
the problem and how to solve it.

I am waiting now more detail (how to increase the signal and what about QRM,
etc).

I talked to a friend of mine who until recently was service manager at
a Lincoln-Mercury dealer. His wife currently has a 2000 Sable. He
said the outlet is fused for 15-amps, and apparently feeds from a
distribution panel fused for 20-amps. I would think you would be OK
with a 50-watt radio as long as you don't put anything else on the
outlet.

Another test would be to take the battery out, and power the radio
from the supplied wall cube. If it operates/ powers up, then most of
the circuit is working.. if not then there is probably a fuse or
resistor used as a fuse blown.

Yaesu does offer an external drop-in charger for this radio, should
you wish to purchase one.

You have to be more specific. Is it a 204A or B or C or D? What is the serial number? Are there any options (see the rear panel for something like option H01)?

Answer these questions and I may be able to help. An ac power supply was standard in the 204C and D, for which I have the manual.

The manufacturer might be using the old audio-amplifier trick of
listing the total power consumed by the radio (output +
losses/overhead) on the packaging, maybe? If they didn't say "2,000
mW RF power out" then they might not be actually lying... just coming
to within a split red fiber-optic of doing so.

I am not going to address your technical issues with getting a higher reading on the wattmeter. What I would like to point out is, even if you manage to get your wattmeter to read 100 watts instead of 50 watts, the change in power is going to be practically unnoticable on the other end. There just isn't enough gain in doing this to make it worth any effort.

Source record: 26272

I have for sale a new Yaesu FT-8100R Transceiver. I got it from the original owner, an elderly fellow who purchased it awhile ago and never applied power to it. He told me that it was just too small. The Yaesu FT-8100R is a dual band (VHF/UHF) mobile radio. Radio is in 100% New Condition (10 out of 10). I used it for about one hour to check it out. The 8100R does cross band repeat. It runs 50 watts on VHF and 35 watts on UHF. The recieve freq. for the 8100R is 110-550 MHz & 750-1300 MHz. (cellular blocked). This radio is capable of recieving v/v u/u or v/u. Included is the mobile mounting bracket, original manual, circuit diagram, original sales receipt,and MH-36B hand microphone w/DTMF keypad,power cable,accessories packet, etc. Price is $295 shipped in Lower 48, Thanks, Charlie Hugg, K5MBX

Hi Bob,

Thanks for the reply. I will have to get back to you. The unit
is out of town, and I won't be able to get to it for a few days.
I am hoping to be able to modify the existing battery charging
circuit so that the batteries will not be necessary.

Thanks again for the time.

cheers, Paul - VA7NT email: paule@sfu.ca

Here is the correct answer:
No one is lying, yet the marketers are using "specsmanship" to their advantage.
The FCC is only interested in ERP (effective radiated power) in the FRS service, so for example your two watt radio has an antenna with a loss (not gain) of 3.8 dB, the ERP on GMRS is 831milliwatts, while on the FRS side, the output power is reduced by another 2.4 dB to meet the FCC limitation of 500 milliwatts ERP.

You are right, you are insane.

There is hardley any existant demand for 'museum quality' Xmitter equipment.
I've tried to rid two of our stations of some quality RCA Xmitters when we
replaced them with Nautels.

We attempted to sell them to collecters, no go. No one wanted them for
anything other than back-up. One went for $500. the other for $575.

If you can get $2,900.00 then you found yourself a sucker.

Z., a couple of months ago, Thierry was complaining of this same
problem. I asked him whether he was measuring ssb with an averaging
meter, vs. a peak-reading meter. He never really responded. I'm not
sure whether he even owns a morse key to look at the difference cw
will get you on an averaging meter, vs. ssb.

Oh, well...

This could be all over the map, depending on the type of wattmeter
used. Very few wattmeters are good at giving an accurate reading of
voice peaks. The meter movements are too slow. If someone see's the
full 100w on SSB, they either have an excellent peak reading
wattmeter, or they are overdriving their radio. I'd say the majority
#2...:/
>

There is no advantage either, if the mike circuit is capable of fully
driving the radio. The circuit you have is surely capable. All you
will end up doing is adding distortion, and lowering the setting you
keep your mike gain.
>
> The problem mainly occurs of the Kenwood TS-570D (all the serie in fact)
> using a handy mic or even a desk model (the ones sold by Kenwood).
> The same problem occurs with the Yaesu 1000 MP (tested at 100 W).

I've never heard of any such problem. You are just being fooled by the
meter. Didn't this type thing come up a few weeks ago?
You have average reading meters, and you have type of peak reading
meters. With NORMAL drive, and average speach, you will usually see
only 25-35 watts on an average meter when doing 100w out. This is
normal!!! Don't try to pump up the gain to get more reading. You will
just overdrive.
Then you have passive peak reading meters. They are always sluggish,
and never read the full actual output. Most will average about 80w
peaks, with actual 100w peaks. All they are doing is adding a small
electrolytic cap to the meters to give some "hang time".
Then you have active peak reading meters. These will be the most

accurate, but still can't be taken as gospel as voice patterns vary.
If you can adjust your mike gain and be within the normal ALC specs
for that radio, you have enough mike drive.
If you can whistle hard into the mike, and get nearly 100w on the
meter, you have enough mike drive.
Don't worry about what you read on SSB. If you are doing 100w CW, you
should be doing it on SSB. Heck, When I run 1300w out, I usually see
only about 400w on average meter voice peaks. Don't think my voice
peaks are really 1300w? Go out and grab the end of my antenna, and get
back to me after the paramedics wake you up. :/ The bottom line.
Very, very few wattmeters are worth a hoot at measuring SSB voice
peaks. You are worrying about an issue that doesn't really exist.
Well, unless the rare case you do have a radio problem, but I doubt
it. A friend of mine runs a 570, and he's made no mention of this
"problem". Misunderstanding wattmeter action is very common among
newer hams. Thats why many overdrive, when they really are not
intending to. They are fooled by those dang blasted meters. :(MK

I just tried, and the radio won't power up off of the supplied power supply at all...also, when I put a charged battery on the radio, it reads an extremely low voltage on the internal voltmeter, and the radio acts like it's going dead (backlight won't turn off, only low power TX)...so it is very possible a risistor got hit....I didn't see any fuses...but I didn't take the radio all the way apart yet...thx..IAN

> Where on the Internet can we find this procedure ?
>
> Thanks in advance

Another note...Most all radios are set up from the factory to have the mike controls match the stock mikes. So if you use the stock hand mike, or stock desk mike, the mike gain controls "should" end up being set in the middle range of the mike gain control. I know on my 706, if using the stock mike, I end up with the mike gain about on "5", which is halfway. This is the way you want your mike set up. So if you add on extra mikes, you want to adjust the gain to match what you have, and let the radio be in the middle of it's range for gain. How to adjust mike gain while talking? I have a method I use, which seems fairly accurate. Set up the radio into a dummy load, and set power output for 100w "full power". Use an average meter, or if peak reading, set to "average".
Then set the mike gain at it's lowest setting. Then speak into the mike in your normal volume, and say x-ray a couple of times at the lowest mike setting. Then adjust the mike gain up a notch at a time, and say x-ray a couple of times while on each increasing setting of mike gain. When you get to the point where increasing the gain makes no change on the indicated watt meter reading, you have full mike drive. I bet if you try this on your radio, you will end up near the half way mark on your mike drive when using a stock mike. When you get to the point where you have no change, set it back to the first setting that gave max reading, and you are pretty dang close to the proper setting. Watching a scope while doing this is even better, but this method is intended for non-scope users. And yes, being this is an average meter being used, you will likely only see voice peaks of 25-35 watts or so. Depends on the voice. If you add a pre-amp to a normal mike circuit, you will overdrive the radios own circuit, and end up at "1" as far as your mike setting. Will make it real touchy, and easy to overdrive.
If you did the "x-ray" test, and could go all the way to the end of the mike gain, and were still seeing increasing average power, and show no signs of clipping at all, it's then possible you would need a preamp. It will be fairly obvious power is down from normal, once you get used to what normal should look like on your particular meter. You can also do a hard whistle test...I have to use a preamp for my audio technica mike when going to the 706. I only get about half drive without it. But thats a case of an aftermarket low Z "200 ohm" mike.

BTW, that same mike element drives my TS-830 with no preamp needed, so radios vary to their mike gain requirements. Many old icoms needed outboard mike preamps. "IE: 730,740, etc.. Also be aware that radios will read different due to audio freq differences also. The bottom line...If you see a point of no increase when adjusting, as when normal, there is no point in adding any preamps. And also no point in worrying what a particular meter reads on voice peaks unless it's radically off from normal. The meter movements just can't keep up. MK

Thanks for the reply! Finally one with information instead of speculation! :)

I'll consider what you've told me, although I am now thinking I might just go ahead and wire it directly to the battery, like I have it in my other car right now.

Two external wattmeters where used.
One is an old one from Yaesu called YS 2000 max reading 2000 W and we
selected both RMS then PEP with a switch.
The other one is a more recent of my friend. I have not its specs for the
moment.

Thierry

I confirm, hence the "misunderstanding" we all had when our friend told us
that he can get 100W in SSB...

That would be the correct reading.

60W is perhaps a bit high, but if you have the compressor turned on
you might get 60W average. Usual peak to average for SSB is a factor
of two or even three.

I am agree of course with your opinion.
If I follow strictly my idea my 570 will stay like it is, and until know I have not made the modification
(For the ones who are interested in this mod I can send you the 2 JPG as attachment. This fix is easy you only need a special cable to plug your mic in the accessory plug if you want to preserve your default mic socket).

This is mainly my friend Al who want this mod because is older TS840S is better excited and he wants to find again this power on his new rig 570 to recah pileups, he says.

Personally, as I have told the mod is not really necessary for me as I can use a linear if needed (although I use it very few excepting at night of during very bad propa). But sometimes I cannot drive my amplifier due the loss of power, my linear requesting at least 80W input to produce up to 2 kW (that I never use, as usually I work at 500-800W output using the beam, never more).

I retain also your comments about passive and active peak meters for the next time. My old Yaesu YS 2000 wattmeter has to be replaced by a more recent model and both reading, RMS and peak I have on my wattmeter, will be necessary on my new one too.

The only way to know for sure is to measure the output of the radio.

My Pryme PR-460 measures 6.5 watts hot off the charger. My Audiovox
GMRS2000 measures 1.75 watts when being powered from a 13.8 volt
source.

Like I had said in an earlier post Andy, there are usually rubber grommets
on the firewall of most cars and trucks that yo could feed the wiring
through, which removes the need for drilling. Good luck.

I am running a Azden PCS 6000-H 2m rig on high power through an accessory port whenever I travel with the Red Cross, as I am usually in a rental car and I doubt that the rental company would like me running wires all over the place, this way too when I am in my hotel I can plug the same rig into my power supply to ragchew a bit before going to bed.

I also have run other rigs this same way and never had any problems, I do however have an inline noise filter in place so as to avoid any alternator or other noise.

No kidding. I'm well aware of that. That's how I've been hooking up my radios for years, but when I move to this other car, I'd prefer not to do that, which is why I asked if anyone had any experience using the accessory port, not if anyone has suggestions for wiring up my radio. Thanks for the input though.

Hi to all,

Anyone got any info on a converted Collins 51S1 for airborne use by
Military
surveillance aircraft. It was done by an outfit known as LTV I think. It is
in a rack mount with locking handles. A few extra controls added in
different shapes so that they could be identified in the dark...

At one time, I did find a site that had pictures of the rig, mounted in a
DC-3. So far, I haven't been able to locate this site the second time.
This is all I have been able to find about this receiver.

Any help appreciated
Thanks to all responses

Don, does it do this when you transmit on a dummy load? If not
I'd start looking for trouble in the antenna system. Maybe try a choke
balun at the feedpoint?

I have a outbacket obm which is the 6 ft model with extra taps for marine hf
as well as full ham hf coverage this antenna is in like new condition..
i have used if a few time in portable operation not mounted on a vehicle
the cost new was 419.00 i am asking 300 shipped conus
i will trade in part or all for a screwdriver type antenna in good condition
superantenna 2/ yaesu atlas/high serria types.
please respond via email, thanx Foster W1CGT

3588. Repeater antenna help needed...

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-07 20:21:56 UTC
From: eclip01 <eclip01@hotmail.com>
Message-ID: <EfFgb.3226$Eo2.1888@newsread2.news.atl.earthlink.net>
Source record: 26212

I am hoping someone can give me some ideas on
this. Thanks in advance for any help you might have.
I am trying this with a Hamtronics REP200 Repeater.
I currently have two ringo, two meter antenna's spaced
50 feet apart vertically and fed with RG213. I have
put these one under the other as suggested by the
repeater mfg and I can't get them to work properly.
I have tried rcv on top and xmt on bottom and the
other way around with little success. I have a bad
de-sense problem either way. I have tried to find
a "sweet spot" and I can find several but none that
are satisfactory. I have been told ringo's are not
good antenna's to try this with because of the fact
they send rf back down the feedline because of the
ring and no radials. I am no antenna expert, but I
am inclined to buy into this. I know the easy way would
be use a duplexer, but I am not into spending a thousand
bucks plus to buy one. I have tried ebay and ended
up with four pieces of junk, so I give up on that.
Anyone have an idea of what kind of antenna's I
would be sucessful with? Also as a side note the
repeater was just in to Hamtronics and got a clean
bill of health, so it is not a repeater problem.
PS>Yes, I have my coax seperated the whole way
from repeater to the ants.

Ok Arnold, your answer solve the problem. I believe the connector
wasnï¿½t the problem. I found a contact connection between the chassis
and the board you said. It is a copper pad rounding the screw hole
that connects to ground through chassis. When I touch near it, the rig
starts to operate normally.

Thank you my friend. Claudio

Get rid of the single shielded coax first. You are getting lots of desense from that alone, especially where the coax passes the lower antenna. Use some 70 ohm catv hardline if you to but make sure it is coated so that the bare shield does not rub on the tower. I have seen where even a 3 foot piece of single shielded coax in a duplex system will cause some desense. You will need more than 50 feet for the seperation. Then get rid of the ringos and get a good antenna. The only way to have a good two meter repeater is to use a duplexer or have a very tall tower and run one antenna up about 50 feet or more and the other one down about 50 feet with the repeater in the middle. Usually the antenna system/duplexer will cost way more than the radio equipment.

You didn't mention what power you were running.

The Ringo is a poor antenna for repeater service. It tends to have a bit of directivity also. Try moving the antenna around a bit and you may find a null. The antenna also has a 'strange' radiation pattern. Puts rf up and down and this causes problems. How do I know this? Years ago we tried them on a 2000 foot high mountain on a TV tower for the Cheaha repeater in Alabama. They sucked to put it mildly.

We ended up with a top fed coliniar made out of coax that worked excellent because to targeted the RF downwards instead of up above the users. Sounds wierd, but it worked.

The RG-213 coax is not a good idea either. Hardline is the only way to go on a repeater.

50 foot sounds a bit close to me. But with a notch filter on the receiver and a clean transmitter it would probably work.

Hope this helps some. I would recommend you read up on repeaters in a older ARRL handbook.

It is typical of mfj companies to eliminate schematics from their
online manuals, but then include schematics in the paper manual you
get with the item.

You might email http://www.w7fg.com or http://www.manualman.com to see
if they have schematics in the paper manuals for which they sell
copies.

It's not a big deal to run wiring through the firewall like that, and when you sell, lease-return or whatever, it's a simple matter of either pulling the wiring out, or just merely clipping the wire on both sides of the firewall. Chances are the next person wouldn't even have a clue that ya did that.

As far as the accessory port, why not just call the damned dealership to find out what the rating is if it is not listed in the owners manual or other places. It's not that hard to do that, nor is it hard to look up the current draw rating for whatever rig you are using and compare those two numbers.

Mike, I just responded to your earilier post before I saw this one, so
I'll do it again here and add some.

There isn't that much more to tell about the G-133, AFAIK. I had one
several years ago for a while. I had long thought I wanted a 51S1 and
the G-133 version is what I came up with. It really doesn't look all
that much like a 51S1, panel is all black with a somewhat different rack
mount front panel, and as you say, some different controls, and all
different knobs. I wasn't impressed with the way it operated and
eventually took it to a hamfest where someone grabbed it at my price
before I could get it unloaded off the truck.
I did run across a younger ham who had worked on the G133 while in the
AF. From far northern Minnesota, he drove to my place in southern Mo to
pick up an AM transmitter I had sold him, and while here he spotted the
G133 and commented that he had worked on them. I don't recall his name
or call now but might be able to dig it up.

The best source for those ratings would be the manufacturer, via the
dealer or the owner's manual. I am certain that there is a wide range
from one manufacturer to another.

As said, a "temporary" wiring job might be simplest.

Happy trails,

http://faqs.jmas.co.jp/FAQs/radio/personal-intro

The various categories are an attempt to bring order out of the chaos.
We don't want to see a swap post on all 15 Radio NG's !!!
One will do just fine at rec.radio.swap

Many don't know or don't honor the guidelines and post to all groups and since this group is unmoderated -- your post should appear as I see 20 or more buy, sell, swap. etc over the last several weeks.
And there is no moderator to enforce the guidelines.

Your message came thru so it is not "How come I cannot post a wanted to buy Message on this newsgroup?"
But rather should I post here? The guidelines will clarify that should you decide to honor the guidelines.

Not playing NG cop --- just FYI since u asked the question

Because there is a special group rec.radio.swap specifically for that
purpose.

I have for sale a Swan VX-2 VOX plug-in unit for the Swan transceivers (500C, etc). It looks really good. I have not used or tested it as I sold my 500C before I tried it. (I do not operate VOX). Pictures on request. If you are interested, please contact me by email or give me a call at 972-231-7511. I'm in the Dallas, TX area and will pay the postage to send it in the US via USPS. Asking $35. Tnx...Fred, W5HTR.

3612. Have you had an FT-817 finals failure?

Newsgroup: rec.radio.amateur.equipment

Source record: 26235

Just wondering how many folks here have had a catastrophic failure of the finals in their FT-817 - with no reason (no over-voltage, high SWR, or other abuse).

I'm getting the impression from some snooping on the Yahoo group that there have been a LOT of FT-817 final failures - perhaps either a design flaw or a bad batch of transistors.

I've sent mine back to Yaesu, with a letter telling them what I've found and that I expect them to make it right, because even though the radio is slightly past the 1 year warranty, it was NOT abused and there seems to be a pattern of these failures.

Just curious how many folks here have had the same failure ...

Source record: 26239

Sam -- most of what is posted on rec.radio.swap is Ham related I
would say 90% of posts are Ham related
But will have some non ham stuff which could be of interest to hams -- such
as on todays listings
filament transformers, SW Receivers, some commercial gear which might be
modded, etc.
One will see scanners, SW gear, broadcast gear, etc.
But overall a good place for Hams to visit to post FS, FA, WTB, WTD, etc.

Some folks get upset with the FA posts as it usually takes one to e-bay,
but hey maybe you will find that rare rare item there
such as a Knight R-100 Receiver -- not all that rare really --
but more likely to appear on e-bay as a FA than a FS on rec.radio.swap

And one must keep in mind rec.radio.swap is free and unmoderated.

As an alternative, Yahoo and others have Ham items for sale see URL:
http://groups.yahoo.com/group/radio-swapshop/

And of course good old E-Bay -- I have found rare items there that I have
never seen else where.
Example a Kenwood Grid Dip meter -- hard to find. I looked for years for
this beauty.

Lots More swap shops at URL:
http://ac6v.com/swap.htm

Includes Price Guides

3617. Yaesu FT-857 - Help getting started....

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-09 15:03:44 UTC
From: ke4uar@bellsouth.net
Message-ID: <889fe625.0310090703.176c156c@posting.google.com>
Source record: 26240

I have recently upgraded to General Class and have only worked a little CW on my dad's Kenwood TS-820S back in 1995. I just purchased a Yaesu FT-857 and made a couple of contacts last night on 40 meters. However, I only have a 40 Meter dipole that a friend let me borrow made of (what looks like) a long spool of paired electric wire like you would find on a household lamp. It must be doing fairly well...

The FT-857 has an SWR Meter in the rig itself, however it leaves much to be desired. I also have never used an antenna tuner before and would like to be able to work some of the other bands using this one antenna and the tuner. Really, this should be a three part question:

1) Can anyone explain the SWR meter on the rig?

2) How do I get a continous tone out of the rig so that I can calibrate my SWR meter?

3) Once I get it calibrated, what would be the process of utilizing the SWR meter and Antenna Tuner together for optimum performance from my rig?

Thanks in advance - 73!

3620. Icom T2H ANI Mode

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-09 20:13:41 UTC
From: kom@micon.com
Message-ID: <739cd602.0310091213.fd262de@posting.google.com>
Source record: 26243

Anyone tried programming Icom 2m HT T2H Sport or T2A to use the ANI mode? (Automatic Number Identification) Not sure whether ANI mode is suitable for ham operation, but just want to test the radio as it stated ANI mode very clearly in the user manual.

According to the user manual page 33:
http://www.icomamerica.com/support/manuals/ic-t2h.pdf
You need to have CS-T2 clone software to turn the ANI mode on. I have two Icom T2H I bought from HRO in September 2003 ($89 each, free shipping, not bad!), OPC-478, and clone software CST2.

I have tried and turned out to be "ANI mode not available" for both brand new radios. The CST2 clone software displayed that message. Called Icom, support person walked me through CST2 clone software, making sure doing the right steps. Then he told me to send the radio in for testing whether they have changed the CPU or not.

Any advice will be appreciated. BTW, Icom T2H is a nice radio; I got a good report on repeater 13 miles away with mobile antenna.

3621. Beware of cheap counterfeit batteries

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-09 20:56:13 UTC
From: felix the cat <0009@yahoo.com>
Message-ID: <1065733680.236212@newshost03.voicenet.com>
Source record: 26244
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

(Note: There was also a report of the same cheap counterfeit
cellphone batteries being sold in the Chicago Regional
Area at discount and "dollar" type stores.
These counterfeit batteries *do not* have any protection diodes
installed inline with the charging contacts, thus if a cellphone
is placed on a conductive surface the internal cells will
quickly overheat resulting in fire and/or injury. The counterfeit Nokia
and Samsung replacement batteries were believed to
have been made in and imported from China)

---------- cut here ----------

Nokia Cites Fake Batteries in Phone Explosions
http://story.news.yahoo.com/news?tmpl=story&u=/nm/20031009/ts_nm/tech_nokia
_explosions_dc

http://www.infoworld.com/article/03/10/09/HNexplodingnokias_1.html

HELSINKI (Reuters) - Nokia (news - web sites) Thursday pointed the finger
at counterfeit batteries after another of its phones exploded and burned
its user, the third such case in two months, and said original batteries
sold with its phones were safe.

The world's largest mobile phone maker said earlier a young Vietnamese
woman was hospitalized with burns after her mobile phone apparently
exploded.

The incident follows two similar accidents in the Netherlands, one last
week and the other in August.

Following the latest Dutch incident, which left a 15-year-old boy in the
town of Hengelo with leg burns, the country's consumer watchdog said it
would probe the case.

"We don't yet have any information on what is the origin of the battery in
the Vietnam case," Nokia Mobile Phones spokesman Kari Tuutti told Reuters.
"(But) there hasn't been a single case of an original battery exploding
anywhere in the world," he said.

Nokia has cited faulty batteries from independent electronics manufacturers
for similar incidents in the past.

Nokia has said these manufacturers violated security requirements which
should prevent the battery heating up after short circuiting, for instance,
after the phone was dropped.

Contraband and counterfeit mobile phone batteries are widely available in Vietnam in local markets at around $2-$3 a piece compared to $20 for genuine product, a local Nokia spokesman said.

"The biggest issue is with counterfeit, illegal batteries," Tuutti said. "Therefore we recommend that retailers and consumers try to verify the products sold have original batteries."

Mobile phones are becoming increasingly popular in Vietnam despite modest incomes and there are around 1.6 million mobile phone users among the population of 80 million.

Is the CST-2 software the original " DOS " Icom software. Its the only
software I am aware of that will allow you to program the ANI mode.
Look at the IC-T2 on the icomamerica.com web site then go to the
software. The photo of the monitor shows the original " DOS " Icom
software.

I don't think the windows version from RT Systems will do ANI mode
programming on the IC-T2. You might give Icom's tech support another
call and ask them to check that out.

Thanks, Gary,

Yes, the CS-T2 is the original "DOS" Icom software dated 1996. Not
the RT system. As matter of fact, I bought RT system's CSW-HH4 after
I have no luck with CS-T2. You are right, CSW-HH4 does not offer ANI
mode at all.

May I ask if you used CS-T2 before, is CS-T2 pretty staright forward
to setup the T2H without any problem? I am able to setup all the ANI
setting and turn the indicate mode to "DTMF ANI" in the program. But
when I trying to save the setting to the radio, the CS-T2 indicates
the radio does not have ANI mode. "Information" query to the radio
returns same result. The thing that puzzle me is the user manual
indicate ANI mode is with the radio, not an "option" which may have to
purchase a board or something. I also asked Icom support is there any
secretary key combination to turn ANI mode on or off? But he said no
such combination for ANI mode. He suspected the radio I have may have
a different CPU. I will try to call Icom again.

Thanks,
Michael KC8YJK

3626. FT-100D question: Is ALC a good indication of modulation?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-10 10:40:36 UTC
From: vhfradiobuff@aol.comspamme
Message-ID: <20031010064036.10366.00000485@mb-m14.aol.com>
Source record: 26149

Hello all. I haven't been using my current FT-100D for very long so I am unsure of how good it sounds on SSB. I have selected the "ALC" display, which, from what I understand, is supposed to indicate modulation. The books says to adjust the mic gain so that 3 or 4 bars are indicated in ALC when talking normally. I can't seem to get 3 or 4 bars when talking normally. On SSB I can see the RF output bar moving and peaking at times. I have the mic gain set at 40 with a Heil HM-10 boom mic. Can anyone offer suggestions for adjusting my audio?

- you can repair it yourself for $50 by ordering the finals
PCB...

- more disturbing however, is the report of one user that
Yaesu blamed his unit's failure on an internal trace break
on the main board - impossible to accomplish unless one
takes the board out for a manual flex or, more likely,
a manufacturing flaw...

> Just curious how many folks here have had the same
> failure ...

- there's a yahoo group named blownfinalsFT-817 ... you can
get a better idea there? the FT817 group is getting tired
of blown final reports... (not something i agree with, mind
you)

- here's the ordering info for the final PCB:

Yaesu Parts Department number: 714-827-7600, extension 2500
Part name is "FT817 Final Unit"
Part number is CB1333001
Price is $43.88 each

- w/S/H via UPS it works out to about $50...

- hope this helps!

i'd agree! i have an ft-857 as well and use a $2 windom semi-stealth
antenna (offset centerfed w/homebrew 4:1 balun)... tuning is done
using an LDG AT11MP...

> The FT-857 has an SWR Meter in the rig itself, however it leaves much

> antenna and the tuner. Really, this should be a three part question:
>
> 1) Can anyone explain the SWR meter on the rig?

not the greatest display... more important is to watch for the
'SWR' message flashing if SWR is out of range... meter is vertical,
and you need to check your menu settings for the display...

> 2) How do I get a continous tone out of the rig so that I can
> calibrate my SWR meter?

drop the power out to 5W, then PTT in AM mode

> 3) Once I get it calibrated, what would be the process of utilizing
> the SWR meter and Antenna Tuner together for optimum performance from
> my rig?

1. cut your antenna as closely as possible to resonance... see the
ARRL's Wire Antenna Classics book, pg. 1-13 for an inexpensive, 4-band
HF wire antenna - no tuner required! but of course, you may want other
bands... i found that my antenna requires no tuning for 20M and 40M,
but easily tunes to 10, 12, 30, 80, and 160M...

2. use a 'real' SWR meter... i find the Yaesu LCD metering worthless
(others may argue this observation)... you'll want to see not only
the SWR, but forward and reflected power for a better idea of your
antenna's efficiency ... you want the most 'out' and not 'back' to
your rig...

3. IMHO, don't screw around with a manual tuner... get the LDG AT11MP,
or if you also have an FT-817, a Z11 QRP tuner (which works up to

60W - which i rarely use, btw)...

FWIW, i like the FT-857... here's what i like:

- multimode (VHF, HF, broadcast SW, AM, FM, etc.)
- small size
- the remote control mic - the reason i bought the rig!
- can use a CW and SSB filter, along with DSP...

here's what's bad:

- mushy sound on HF; this rig's design (as with all multimode rigs) is a tradeoff on size and features... OK as a 2M, broadcast radio, but something has to give on squeezing design features in, and i think the HF end isn't that good (even though i've made 5,000-mile contacts - the experience wasn't pleasant)...

- fan turns on no matter what power setting

- display - metering, as you've pointed out, is quite confusing, non-intuitive... signal strength reporting is worthless, IMHO...

hth!

But there is a pattern of an abnormally high failure rate,
indicating a design flaw, manufacturing defect, or perhaps
a bad batch of transistors ... I don't think users should be
forced to pay for things like that when there has been NO
abuse of any sort.

> - more disturbing however, is the report of one user that

Thanks for that info ... if Yaesu doesn't do right by me on this one
I'll have to go that route ... but I still think they should repair this
on their own nickle - the radio was used only 3 or 4 times. Had
I used the radio more, this would have likely occured during,
rather than a bit after the warranty period (but the radio is for a
backpack station for travel use, which is why the low usage).

Interesting Drake Collectible for Sale

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$90 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.

This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm

Here are a bunch of items for sale. Prices do not include shipping. I
will ship overseas.

Swan WM-2000 Wattmeter.....$75 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is
measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.

http://members.cox.net/radiostuff9/drake2m3.jpg

Black National HRO PW Dial and Gearbox.....$100 plus shipping
I believe the dial is NOS however the gearbox is used but in
very good condition. This is the type of dial used on the famous
National HRO, NC-100 and NC-101X receivers.
http://members.cox.net/radiostuff9/hrodial.jpg
http://members.cox.net/radiostuff9/hrodial2.jpg

DrakeNational MCN Dial ? New in the Boxï¿½ï¿½..$45 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½ï¿½$10 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover on
one is broken but the unit is OK
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

Sprague TO-4 Capacitor Testerï¿½ï¿½ï¿½..$125 plus shipping
This unit is in excellent condition and works great. The front panel
still shines like a new unit. Includes a copy of the manual
http://members.cox.net/radiostuff9/sprague_to4.jpg
http://members.cox.net/radiostuff9/sprague_to42.jpg

ZM-3A/U Capacitance Analyzer.....$100 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet.
http://members.cox.net/radiostuff9/zm32.jpg

JAN 7293 4CX250 plus socket and Eimac SK-606 Chimneyï¿½ï¿½..$40 per set plus
Shipping.
Tubes and chimneys appear to be NOS. Sockets are used. I have three sets
of these
http://members.cox.net/radiostuff9/4cx250.jpg
http://members.cox.net/radiostuff9/4cx2502.jpg

3635. Suggestions on rig/antenna installation/wiring in 2003 Ford Explorer

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-10 18:30:03 UTC
From: "Carl R. Stevenson" <wk3cqth@wk3c.com>
Message-ID: <LUChb.616$_i.49017@nnrp1.ptd.net>
Source record: 26158
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Hello all,

I am fortunate enough to have just acquired a new 2003 Ford Explorer (4x4, 4-door model) and wanted to solicit input from other owners of this vehicle as to their experiences with VHF/UHF and HF rig and antenna installation and wiring issues.

I thought I might benefit from the experience of others in locating the wiring channels, good paths through the firewall to the battery, and perhaps experience in locating "remote head" radios in the forward of the two rear under-deck storage areas (or other locations).

I plan to install a 2m/70cm transceiver and an HF plus (at least) 6m multiband rig in the vehicle. (probably both Yaesu).

Additionally, any "gotchas" on mounting remote heads on the center console, etc. would be appreciated. (don't want to drill into something behind a pannel, but don't want to have to tear the whole vehicle apart to see what's behind, either, if it can be helped)

73 and thanks in advance for any insights that owners of this vehicle may provide,

Carl - wk3c

I don't own a Ford Exploder (WHOOPS! Just kiddin'),
I mean EXPLORER, but my Chevy S-10 shouldn't be all
that different. Most of the wiring can be chased down down thru the engine
compartment and into the driver area via the door drip rails/strips. After
checking under there for any wiring harnesses, a hole can be drilled thru
and wires should be able to get in under the dash from there. Make sure that
the wires don't get where the wheels can rub against them when they are
turned hard to one side. I use grommets in these holes (Radio Shack has
them) to prevent wires from being chafed due to unseen burrs. It should be
an easy run from there under the carpet to the radio or control head. If the
radio is remoted, the control cable can be routed the same way, routing
same from the radio/head under the drip rail/channel to the correct
location. Same thing with the antenna coax. If the HF antenna is at the
rear, one can come from under the bumper along the frame and use wire ties
to prevent chafing. Keep your wiring harnesses away from existing wiring
lest you find yourself with some other issues (ignition noise, whines, *

funny* occurrances like wipers coming on, engine stalling, etc.). One advantage of running cables this way is, when the drip channel molding is replaced, one can't tell there was ever any wires under there. Oh, BTW, Where the wires enter the vehicle, be sure to leave a little drip loop in the cable to keep water from wicking its way inside and ruining the carpet. Of course, the alternate method would be to find a plug in the firewall where wires can come in under the carpet.

One thing I always do is to take a little time to survey the proposed installation and see how best to do the job. A bit of forethought can save a botched installation. This is where one looks carefully at surfaces for possible hidden wires. *IF* there is a lip or an angled surface next an accessory, such as the radio/tape player, you can often tell if you might hurt anything. If the dash has a "lip" or a channel where it is too narrow for any harnesses to fit inside, usually it is *safe* to attach small screws. If one is not comfortable with that, then he may want to remove the console. Look for cup holders, panels, ash trays, etc.
that might be removed with a simple lift of a screwdriver so that the console may not have to be removed in toto. My shift console was quickly removed with the 4 screws/bolts existing.

Your VHF/UHF antenna can be attached to the luggage rack and the coax chased down between the doors and inside that way--being careful that the doors don't pinch the feedline or rub it in two.

Being a builder and an avid HF user, I would recommend the Carolina Cyclone (my own brand) screwdriver. The screwdriver concept is about the best, most versatile way to go HF AND 6 Meters. With the exception of 160 Meters, getting 80 thru 70 CM is quite easy. And it makes the spouse happier not having to have a multitude of antennas flopping around the car (two antennas--an HF antenna, and a dual band VHF/70 cm).

In a nutshell, each installation is different and requires a bit of that pre-install survey and some imagination. I think you will do fine! And, of course, if you need a great HF antenna, just let me know! LOL!

Michael,

I used to work at Icom,been away for over 2 years now. I have used the CS-T2. BUT I am not aware of any CPU change that would leave out the ANI mode. I do not remember any optional board requirements for the ANI mode only the CS-T2 software was required to enable that mode. It might be there was something more desired in the T2 so the factory made such a change. Yes maybe another call to Icom for clarification of the possible trouble would be in order.

In past years a cpu change happened on the 2SAT and 24AT for offset tuning around serial 9500. The original offset tuning step was limited to 25 khz steps and we complained so the factory changed to a cpu that allowed tuning steps of 5 khz which was better for odd offset repeaters and MARS operations.

Is this about the same as the "sel-call" used in aviation? If so, no.
I know of no ham rigs that include that. But airnav sells a sel-cal
decoder for computer.
You can get a working demo on the web at their site.
I don't know if this would work for your needs though. The aviation
sel-cal uses a 4 letter code, IE: EKBN or whatever...But on the radio
you hear two tones of different pitches. IE: beeeeeep, booooooop, or
whatever. I *think* the two tones heard are mixtures of two tones
themselves, hence the 4 letter code, but not sure. Seems like I've
heard fire station calls that had about the same type of sound, now
that I think about it. But don't know if compatable or not. I guess
you could try the free sel call demo and see if it will work. MK

I don't know if it's Select Call - I think that's another tone.

You can hear the tone at
http://www.firescan.net/cgi-bin/chindex.cgi?by=page&ch=2 - click on
any link.

I'd prefer it in a handheld...

Thanks. :)

Evan

I know of no amateur transceivers that do two-tone select calling.
Icom's IC-F30GS does, it will also operate within the 2 meter amateur
radio bands. Other commerical transceivers do two tone select calling
too.

What I don't remember is if you can scan with the 2 tone select
calling enmabled. If you docan there is a possibility of missing a
call as you are scanning channels other than the primariy 2 tone
select call channel.

Almost all of the Motorla units will do it. When I lived in the states,
my family and I each had motorola handhelds that responded to quick
call II codes. We would get on the local repeater, ID, issue the codes
to the repeater controler to activate the quick call tones and then call
the others.

I also had a voice pager sitting in an amplified charger unit in my
living room.

Geoff.

You can't do better than the K2/100 for the price. Even at 5X the price, the dynamic range and overall performance can't be beat! The SSB option is transparent to its presence. I also have the TenTec Omni VI and the K2 outperforms it hands down! In addition, the TenTec Omni VI if full of digital birdies on 20 - 10-meters. Virtually NONE on the K2. Just do it! You won't regret the decision. Lack of a processor is nothing to be concerned about. The effect of a processor is usually overated, anyhow. Good radio!

Dunno, I would use the method I described in a similar post the other
day.
Use an average meter, and talk and adjust until you get to a point
you see no visible increase on the wattmeter. A stock mike should be
at about the half way point of the mike gain. If you can go all the
way up, and still see increases, you may need a preamp. Not familiar
with the yeasu mike setups...My 706 needs one using my audio technica
mike, but fairly normal for the icoms. A heil needs a preamp to have
enough drive on the 706. Might need one on the ft-100, but I'm not
sure. Compare it with the stock mike, and see if you see a large
difference in mike drive. MK

I'd like to see that too.
Mine is GPIB, so not useful for most people. I'd like
a simpler one.
Depends a little on what chemistry you're talking about.
I thought about using a PIC for the A/D and low level stuff
serial interfaced to a HPC for the GUI.
But the 10-bit A/D is a little thin
for detecting small slope changes on NiMH.

Looking for absolutely the easiest 70cm/440 Mhz ham HT mod. Prefer no soldering, cutting wires, etc.

I would like to open up TX range to the 430 to 470 area. Recent model radio (year 1999+) desired.

Thanks!

BILL

3671. Re: HP204 power supply question

Source record: 26194

<< I have an HP204 audio generator, with shot batteries,
has anyone modified one of these to run strictly off
the 120v mains? >>

Paul-

I don't have any information about the older 204A or 204B. I purchased an HP 204C from someone on E-Bay, that turned out to have badly leaking batteries. I could tell from the photograph that there had been leakage, so I bid accordingly! The corrosion was so bad that it would have been difficult to renovate the power supply. I also took the approach of changing it to an AC-only power supply.

I was able to find a military manual on the web, TM 11-6625-1589-15-1, for the HP 204C. I also found a manual for the HP 204C/204D, but it was incomplete. Together they have about anything you need. I think you can find them by doing a Google search.

It seems that the batteries are divided into four groups of five NiCd cells each. They are wired in two pairs, for a plus 13 volts and minus 13 volts supply. They normally operate in a trickle-charge mode, so each cell is about 1.3 volts. The AC battery charger provides sufficient current to operate the oscillator and also charge the batteries.

The solution is simple. I used two twelve volt zener diodes, with each wired in place of a pair of battery packs. The battery charger supplies sufficient current so voltage doesn't drop below the zener knee of the diodes. Although twelve is less than the usual thirteen volts, I found a reference in the manuals that the power supply voltage was rated to be a minimum of plus and minus eleven volts. Certainly the voltage would have been twelve volts nominal when operating from batteries alone.

I can't find my notes, but believe the diodes used were 1N4742A, 12 Volt 5% 1 Watt zener diodes. Two are supplied in a pack from Radio Shack, stock number 276-563.

The hardest part was cleaning up the mess from the batteries!

Hi Carl,

I'm using double faced tape to hold the mount for the head of an Icom 706 in place on the console of a Jeep. Should work also in an Explorer. This allows you to remove the head and pt it out of site when the car is parked.

I'm using a license plate mount for Hamstick antennas in the mobile.

Good luck.

Sorry for the xpost. A good friend of mine, John WB2ISI recently passed away and his widow w/3 kids under 18 asked me to try and dispose of his equipment as follows:
AIM 20 amp power supply
Kenwood 2 meter transceiver TR-7850 slight wear, missing rt side panel.
Yeasu YS200 Watt/SWR meter w/mic No dents/dings, slight paint wear.
National NC-33 receiver, fair appearance, no dents/dings, power cord needs work.
Icom IC 751 fair appearance. Needs back cover.
Tubes:
62011/12AT7WA 1 piece
6AL5 1 piece
6L6 G 2 pieces
866 A 2 pieces
2A3 4 pieces
5881 1 piece
811A 1 piece
5V4 qa 1 piece
811 2 pieces
6J5 1 piece
12AX7 1 piece
6083/AX 9909 (Amperex) 1 piece
6083 (Amperex) 1 piece

Again I am sorry for the xpost but my mates family could use the funds from whatever can be sold. 73, Jim.

Exactly. And buying off the governments of Middle Eastern nations has been proven, short-term, to
not make any difference in their citizens' opinions of the U.S. Gov. In fact, a majority of them
swing against, with Israel in the minority.

Looking for these tubes:

(1) 6BQ5 (final amp in an old CB that I'm repairing)
(1) 6HF8 (audio amp for one of my two Heath HW-16's)
(2) 6DC6 (for a Halli SX-117 rcvr that I'm restoring)

Good used ones are fine. It would be nice to get them
all from one person so that I only have to pay one bill
for shipping.

Yes, Virginia, I am well aware of all of the tube vendors,
such as Antique Electronic Supply, RF Parts Co., Surplus
Sales of NE, and so forth. Tryin' to save some $$$ here!

3692. Help HP8551B spec please?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-13 14:19:57 UTC
From: Dave Bullock <DaveB@ihr.mrc.ac.uk>
Message-ID: <3F8AB48D.3010604@ihr.mrc.ac.uk>
Source record: 26115

Dear Hamsters,

Does anyone have any information on the specification for a Hewlett
Packard HP8551B spectrum analyser.
I have read it has a very wide range but wonder if there are external
units to fully realise this.
I have the option of the display and RF unit, what will this cover on
it's own?

Thanks...

Dave

3693. kenwood TS570 series secundary menu

Hi,

Kenwood provides a manual with its TS-570D series explaining how to access the standard menu but as usual, they don't mention that there is another menu, a secundary one that each of us can set according our needs... One more undocumented feature to Kenwood !

Does someone know how to access this secundary menu ?
If you prefer you can send me a private email.

Thanks in advance.

The coax input frequency range is 10.1 MHz to 12 GHz. With external mixers and adapters to provide a waveguide input, 8.2 to 40 GHz.

This is a very old piece of equipment. More often than not, the BWO is weak, or even bad. Unless it is an offer that you cannot refuse (like free or real cheap), and includes the interconnecting cables, stay away from it.

Bob, W6NBI

Hi,

Are you speaking about the menu aligning the radio and that requires test
equipment to set several of the parameters ?
Does it includes the setting of SSB power and related ?

3697. Need a Icom Hand mic

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-13 17:33:19 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <zlBib.37$ZE1.7@news1.central.cox.net>
Source record: 26120

I need a mic for my Icom IC-281H. The old mic causes the transceiver to lock
into transmit when it is turned on.
I need one with the modular type 8 pin plug like is on the mic that goes
with the IC706s. It is a HM103, I believe.
The stock mic for the IC-281H is the HM77, 78, or 79.
If you have an Icom mic that will work on this radio, please let me know.
Thanks, Charlie Hugg, K5MBX

What happened to the covers? Without covers, these radios are reduced to the status of parts rigs. What about microphones and manuals and mobile brackets?

I have an IC-751 I like but I wonder what you mean by the back cover.

Perhaps you can guess at a price for everything and I might take it all, in hopes of fixing up some of the stuff to get my money back and then having the rest gratis.

Let me know.

You ->might just have a nice aluminum case made by Zero-Halliburton, which doesn't have any connection with that other Halliburton, so far as I know.

Don't know about BPL, but VDSL goes from 138KHz to 12MHz and has 4096 tones. Not as much potential for a problem, as it's all twisted pair rather than power lines.

broadband DMT modems do not have selectivity. They use wideband filters in the front end and line driver areas (or perhaps none, in case of annex C) and do the frequency selection in DSP. They don't have "adequate selectivity characteristics". But then I assume too much about BPL. I think the selectivity clause will stick though.

Nor are they receiving transmissions from "stations in the domestic
broadcast service". In fact, BPL systems do not appear to me to be
"stations" operating in _any_ service. Hence, I don't think that
either clause of 97.121 applies.

That's not to say that the FCC won't contrive to pull a "through the
looking glass" inversion, and come out with a ruling requiring
licensed radio services to shut down to protect unlicensed land-line
services.

I just purchased a Heil Goldline mic and was wondering if anyone is using a boom type mic stand with this mic. I know little about what are the good mic stands. I see some stands have a *shock* feature to reduce vibration during movement. Is this that important? Any advice would be appreciated.

Just got a Goldline mic myself. It was part of a package deal that included the boom stand, shock mount and foot switch. Really a very nice set up. I have always wanted this combo and am not sorry that I ordered it. The boom sure makes it easy to get the mic where you want it, between radios and computers. The shock mount I guess would not be necessary but makes it very easy to mount the mic to the boom, besides it looks cool. The foot switch I think is just about a must, vox works okay but the switch is very well made and works really well. Just my 2 cents worth.

heh heh... Heil Sound has just what you're looking for. www.heilsound.com

A shock-mounted mic is important if you don't want the guy at the other end
to hear:

you writing in the log,
you push the mic out of the way,
people walking across the floor,
or you sliding the mouse around.

All that and more gets transmitted up the boom to the mic.

Source record: 26140

Hi everybody,

I am looking for a wideband receiver (up to 1GHz) that has a connector
for the last IF signal before the demodulation.

I would like to use the receiver just as downconverter and then do the
demodulation myself by doing an A/D conversion followed by some signal
processing on a PC.

Which receivers are best suited for this purpose?

Are there any receivers that can be controlled by a PC? I would like to
tune the frequency with the PC.

Thanks!

Stefan

The ICOM IC-R8500 tunes up to 2 GHz, has a 10.7 MHz wide band
IF output, and a computer interface. The IF is a few MHz wide
when tuning the receiver above 30 MHz.

I wrote tk8500 open source control software, which you may download

3724. Help on a 465M

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-14 14:54:36 UTC
From: Bill Brobeck <billbrobeck@earthlink.net>
Message-ID: <M6Uib.660$s93.454@newsread3.news.pas.earthlink.net>
Source record: 25998
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,sci.electronics,sci.electronics.equipment,sci.electronics.repair

I recently bought a 465m for $50 for my son to play with. (I had an Eico when I was a kid.) The trace is not so good.I opened it up and found -3.0 VDC on a TP that is supposed to be -5VDC. The +32 and +5 are OK. Looking at the various articles on the web and talking to a couple of people, including Deane Kidd, I concluded that

1) I need a good manual for as little money as possible.
2) Some advice based on your experiences as to which can is probably bad.
3) I have the original instruction manual for a 564B. Is the instruction manual for the 465M just as comprehensive?

Also I a little weary of really getting into it. I used to repair TV's when I was a kid, and got nailed one too many times, so a good manual is important.

Any kind of advice, besides drop kicking it into the creek, would be appreciated. My son just got a 30 in 1 kit, sort of similar to the Allied Radio 100 in 1 kit I used to play with....but allot more IC minded...really cool stuff. I think it is important for him to see what happens to circuits over time...thats why I needed dual channels..

Thanks in advance

Bill Brobeck

> 1) I need a good manual for as little money as possible.

Don't be afraid to invest -- and I use that term deliberately --
$50 or so for a good condition manual. The 465 and 475 series is some of
the best hardware that Tektronix ever turned out.

Manuals Plus has an operating/service manual for the 465M, in the
form of a military tech manual reprint, for $55.00.

http://www.manualsplus.com/mpstore/product.asp?sku=75135&dept%5Fid=1

HOWEVER -- Join, and check with, the gang on Yahoo's 'TekScopes'
mailing list before you buy. They may be able to point you to a .pdf
copy.

> 2) Some advice based on your experiences as to which can is probably bad.

Could be anything, but electrolytic filter caps have been known to
degrade over time. The ironic part about owning a 'scope is that you
often need a working one to fix the bad one.

> 3) I have the original instruction manual for a 564B. Is the instruction
> manual for the 465M just as comprehensive?

Very much so. The 465 and 475 series was made well before
Tektronix's manuals deteriorated into near-useless thicker-than-normal
pamphlets.

> Also I a little weary of really getting into it. I used to repair TV's when
> I was a kid, and got nailed one too many times, so a good manual is

Troubleshooting test gear is not for the faint of heart. You would
also do well to join the Tekscopes mailing list off of Yahoo groups.
I've been a member for some time, and have gotten excellent advice for
my own stuff.

http://groups.yahoo.com/group/TekScopes/

> Any kind of advice, besides drop kicking it into the creek...

Anyone who even hints that you should drop-kick any such
'classic' instrument anywhere is a good candidate for having the same
treatment delivered to their own derriere.

You've got a fine instrument there. Good luck with it.

>1) I need a good manual for as little money as possible.

Definitely worth having.

Check with http://www.aa4df.com/testeqpt.htm - the operating manual
for the 465, and the service manual for the 465M are both available in
electronic form (PDF scanned images of the paper originals, I assume).
$9 if you FTP the manual, $12.85 if you want it on CD.

>2) Some advice based on your experiences as to which can is probably bad.

Well, it's probably the filter can for the +5 rail! The manual will
make it quite clear which one it is. If I recall correctly, most of
the main filter caps are all in one small area of the main PCB - right
rear as you look at the scope from front/above, I think.

>3) I have the original instruction manual for a 564B. Is the instruction
>manual for the 465M just as comprehensive?

The service-and-operations manual for the 465 is very good indeed. I
can't compare it to the 564B manual as I've never seen the latter.

>Any kind of advice, besides drop kicking it into the creek, would be
>appreciated. My son just got a 30 in 1 kit, sort of similar to the Allied
>Radio 100 in 1 kit I used to play with....but allot more IC minded...really
>cool stuff. I think it is important for him to see what happens to circuits
>over time...thats why I needed dual channels..

From what I have heard, the commonest problem with these 'scopes is
that the filter capacitors for the DC supply rails simply fail due to
old age - the water from the electrolyte diffuses out of the case, and
the caps go high-ESR and cease to filter.

I picked up a used-but-working 465 a couple of years ago for all of
$25. It went belly-up about a year later, with the trace wobbling all
over the place and the controls pretty much dead. DVM testing showed
that one of the DC supplies had many volts of AC ripple on it... the

filter cap had failed.

Unfortunately, the original filter capacitors for the 465 are no longer being made, and the original supply of spares at Tek has run out. So, you probably won't be able to find an exact replacement. That's the bad news.

The good news is that you'll almost certainly be able to pooge in a modern 'lytic, of equal or greater capacity and equal-or-higher WVDC rating. Buying high-temperature-rated caps wouldn't be a bad idea due to their proximity to the CRT.

What I did was unsolder the existing cap can (+ and - tabs, and four (?) mounting tabs around the perimeter) and remove it. I bought a suitable replacement (somewhat smaller) at a local electronics store. The pins on the replacement didn't line up with the thru-holes in the PC board, so I cut/bent/soldered some long extension/adapter leads using 16-gauge solid copper wire, threaded the ends of the wires through the holes and then pulled them through (snaking the new can down to within about an inch of the PC board), cut the excess wires and soldered, and then glued the can to two of the adjacent original capacitor cans using some electronics-grade silicone sealant. Although the new can isn't actually fastened down to the PC board, the combination of the leads, and the adhesive holds it firmly in place without putting stress on anything.

The 465 fired right up, and it works fine now. Well worth the couple of bucks, and the several hours it took to diagnose the problem and repair it.

I've been advised that it's a good idea to power up scopes like this occasionally, just to make sure that the electrolytic caps do not de-form due to unuse.

Offer the guy's family $5.00 bucks.
You just want the stuff for nothing.
I see it time and time again. Slime like you hang around waiting for a ham to pass on
and then you want the equipment for practically nothing. Then you sell off the stuff for a profit.
You make me sick.

And Jim, Sorry about your friend. You should take some digital pics of the equipment and put the stuff on Ebay. There you will get the most money for the family.

73 and good luck!!

I think the ARRL is important as it was 43 years ago.

I'm a 43 year supporter and I will be as long as I'm a air breathing
walking talking ham.

The ARRL is us. It is our voice in Washington.

Source record: 26011

I was going to list these items on Ebay, and figured I would give it a shot here first. I have a Yaesu FT-51r HT with the MH-29 remote control speaker mic. It has 1 Yaesu and 1 aftermarket 9.6v (5 watt) and 1 Yaesu 4.8 volt battery. It has the original Yaesu desk charger and an aftermarket quick charger. There is the E-DC-12 Mobile adapter/charger. Also the CSC-66 leather case for use with the 9.6v batts. I have owned the rig for about 2 years and am a non-smoker. It functions perfectly and has NO scratches on the displays, the radio or the mic. It has the factory dual-band antenna. I used it a few times in my truck, otherwise it sat here on my desk. I have the original box and manual. Also included in the package is a Power Plus 2mtr amplifier with receive preamp. Its 5w in 35-40w out. It also functions perfectly but is missing the mobile mounting bracket, as I never used it. You can see pictures of the equipment at http://home.earthlink.net/~snowleopard99/Ft51/ft51r.html
If you have any questions, feel free to ask here or in e-mail, just remove the NOSPAM
I am just getting out of the hobby for now, as other things have caught my interest (namely target shooting) and there isn't really much activity in my area anyway.
I will start out asking $400.00 for the package. If you have offers let me hear, and I would also consider trades on firearms.
Thanks, James KB9LTJ

fmmck@aol.com (Fred McKenzie) writes:
Thanks to all who replied. It turns out that the one I have is
the 204c. I put two zeners and caps in place of the batteries
and now the +/- voltages are correct. Now the rest of the
trouble shooting begins.

First of all, I am not able to adjust the bias voltage to the
specified level. It stays at around 3v. The oscillator
will work occasionally, and I tried cleaning the switch
to get it more reliable with some contact cleaner and now
I cannot get it to work at all with the case on.

Any suggestions as to some likely trouble spots? There does
not appear to be any damage from the batteries.

Thanks in advance.

I should imagine that DRM will catch on as quickly as DAB, i.e. no-one is even
the slightest bit interested.
The best mode for HF is SSB.
After all the years that DAB has been around, very few people have DAB
receivers & those that have say the audio is worse than FM.

Maybe for you...and some hams but I remind you that the HF spectrum is first
of all used by thousands civilian and military services.
See the first xls files on http://www.astrosurf.com/lombry/qsl-download.htm
DRM is dedicated to all these AM broadcasters and services.

> The best mode for HF is SSB.

Hi,

The best surely not -see the widespread of FM - the easier to put in place
certainly.
At first sight and for longtime the ham community will continue using his
usual modes. The objective is not to replace our modes of communications.
The text states well that DRM will replace analog AM with digital AM, not
USB, LSB or CW.

Thanks for your answers!

I had a look at both receivers and both are really nice. However, of course these receivers also have their price.

Are there actually vendors that sell plain RF-Frontends? I just need a device (it doesn't need to be able to transmit signals) that can be used to downconvert signals in the range up to 1GHz down to some intermediate frequency. Is there any low-cost solution?

Thanks,

Stefan

Update:
Called Icom again on 10/14. I told Icom support (different person)
that I have problem programming ANI mode into my Icom T2H. He
mentioned that T2H is an amateur radio, it should not have ANI mode.
But after checked on the manual, he agreed that it has ANI mode. And
again he walked me through the CST2 in the Common screen. I think we
all doing the correct setting "DTMF/ANI Mode" etc. He told me he will
check it up and call me back.

I will post the final result here for anyone who is interested in Icom
T2H ANI mode.

A suggestion if it's an Icom rig. Icom rigs, most notably the 706, will not transmit full output with any input under 13+ volts. Vehicle has to be running.

Another problem is the rig shutting down and restarting every time you crank your engine. This isn't good for the rig, no mater who makes it. I have read reports of memory loss from this.

Go to your local car audio installer and get a 1/2 or 1 farad cap and hook it up in line between your radio and power source. No more spike or power drops when starting your vehicle.

Tttt
I like FM but I continue to appreiate SSB too
I like CW but I use packet too.
If you like these oldies, why are you using a high-end transceiver ? You
should use the oldest one and work exclusively with a CW key.

The same objection was already formalted about echolink... see
http://www.astrosurf.com/lombry/qsl-echolink3.htm

Live with your time and take advantage of the new technologies without
rejecting them.
In all case, the train of progress is there and will continue on iits path
with, or without you.
So if you are smart enough, take the train as we all do ;-)

3752. Electrolytic caps question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-15 23:37:21 UTC
From: mwh87120@yahoo.com
Message-ID: <d9ce95a5.0310151537.7f3029c2@posting.google.com>
Source record: 26025

I have obtained some surplus linear regulated power supplies. The
date code for the electrolytic caps in the filter section are late
1993. I've not powered these
supplies up. I know that these caps have a limited life. These caps
are also
harder to come by due to the proliferation of switch mode power
supplies and
their lower values. Any ideas/suggestions to minimize stress to these
caps
or even rejuvinate, if possible, these caps. I'm aware of inrush
current at
supply turn on and I plan to minimize that. Any other ideas or
suggestions???

You have three choices:

1. Bring the things up slowly, on a variac. This allows the capacitors
to slowly reform.

2. Bring the things up for a while with a 60W light bulb in series, then
apply full power. Same basic principle, if you don't have a variac, but
slower.

3. Apply full power. If any caps blow, they were marginal and should have
been replaced anyway.

I tend to be a fan of method #3, but I can understand the arguments in favor
of the first two. But caps that are only a decade old? Don't sweat it.

I always shut off my radios prior to starting my vehicle. Too risky NOT to.

Good job Kevin !

To complete Kevin's post, I received a mail from Valentin Strashinski, the project manager saying this that could convince you in participating in this project.

Thierry
ON4SKY

"After catastrophe of Columbia some things on ISS and also scientific activity come with additional difficulty. However the Shadow project in its "cold" phase may use available equipment on board and takes minimal time of astronauts, so it may begin, say, this autumn (or winter) if we will be fast in managing of the receiving network. Under the current circumstance it will be not only a particular scientific task, but also a distinct public support of space researches in general. So if we can do it, I think we must do this job together in memory of Columbia and its crew.
Your participation is thus warmly welcome in measuring field."

Hi,

Many foreigners who don't speak French requested a translation of my webpages... Unfortunately I am unable to translate my thousand pages in English or any other language. The job is too time-consuming. However I do it from time to time if a subject can potentialy interest the all community of amateurs.

Therefore I selected another method : using Altavista Systran tool. It is quite useful. I made some tests translating my English page in French, German or other language. The result is better than expected. Of course they are errors but it is more useful that being face to a text which you do not understand the slightest word !

Now you have no more excuse to read my pages in plain English, Spanish or German or even Corean !
Subjects currently presented are Basics of Astrophysics, Cosmology, Bioastronomy, Quantum physics, Relativity, Evolution, Radio amateur and much more, for a total of about 800 MB, 240 films, and 6000 images on line. The site is update practically every day.

The translation tool is displayed at left, button "Translate". It is easy to find.
Enter some words or the concerned page URL, press Translate, that's all. The page is translated in your language. Fast, and easy.

If the routine interest you, check on
http://www.altavista.com/help/free/free_searchbox_transl

Your feedback is welcome ;-)

Hope this helps.

Many manufacturers of aluminum electrolytic caps recommend they be reformed
after 18 months of storage, others say 2 years, and others say 3 years.

I have a 706 MKIIg in a 2003 Ranger. I don't know if this is applicable or not but thought I'd pass it on.

How can I run Power and antennas out of vehicle to battery, antenna mounts etc.?

Answer: In my old Ranger [1985] just below the driver side left hip under the floor mat is a 3/4 inch drain hole with a grommet as a plug. I released the aluminum cover from the door/mat area and lifted the mat. Sure enough the plug was there!! I clipped out a 3/8 diameter section from the center of the grommet and sliced one end open. After running the necessary wires through the grommet it was reinstalled and sealed with Coax-Seal [$3.00 at HRO].

There was no need to punch holes, drill holes, etc.

Jerry,

Are you telling me you have NEVER turned the key with the radios on? Never?
Ah come on... it happens to the best of us. :-)

I actually learned to use the CAPs when I had a AL500. It cured all dimming
of head lights and other electrical devices in the vehicle when keying. I
had two of them and have used at leat one of them with every new vehicle I
have gotten even though I no longer run an amp. I see it as another safety
device. It also has an added benefit, it does a good job if you have a
little alternator whine.

My wife's old Honda would dim its headlights every time a 40 watt 2 meter
rig was keyed. (Small battery and my guess, a smaller alternator.)

May be, but you would have to also put a diode in line, in front of the capacitor, to prevent the capacitor from helping to start the engine, and that loses 0.5 of a volt unless you get a special one !

Nick

3774. Dead Kenwood VC-H1 - help!

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-17 01:54:41 UTC
From: rrochte@gpacademy.org
Message-ID: <728f039e.0310161754.332adad8@posting.google.com>
Source record: 26047
Cross-posted to: rec.radio.amateur.equipment,sci.electronics.repair

I just purchased a used Kenwood VC-H1 SSTV scan converter for use in our amateur radio balloon programme at the Grosse Pointe Academy and it seems I've managed to kill it after only one day.

The unit worked just fine until I tried to connect an external video camera to it. Unfortunately, I tried to do this at the end of a long day and - not thinking too clearly - I tried to plug in the camera while the unit was switched on. Not only that, but I also took a shortcut in making the connector (stupid, I know) and connected the video to both the tip and the ring of the stereo plug. I realize now that the tip (I think it is) should have been left alone - it supplies +5v to the stock camera.

Anyway, after plugging the external camera into the unit, it at first functioned but displayed no video. The backlight was running at the time, so the screen was visible (LEDs were also on) but there was simply no video to display. As I was pulling the plug back out (with the unit still switched on), though, everything blinked off.

It is now dead with a capital "D" - no lights, no video, no nothing. Since the unit is used and thus not under any warranty, I figured I might as well open it up and look inside - praying that just maybe there was a fuse...

Well, no fuse, but many discrete SMT components. Is it possible that one of these is a voltage regulator and I shorted it out when I was pulling the plug? Something I can replace (or just test somehow)?

Does anyone know of anything else that I can look for on this board, specific components that might have been damaged, etc., or am I looking at a new main board? If the latter, then I guess I've probably just wasted the last of our tiny budget on an expensive paper weight - and I'm gonna have a bunch of really disappointed (and not so happy with me!) kids on my hands....

Thanks in advance for any help or suggestions.

73,
Robert

work?
======
Having a 5 volts filament ,requiring 14.5 Amperes ,would make it a nice 70 +
Watts (anti-condensation) heater.

Applying 12V would turn it in a 'RIP state' within a few seconds.

I am going to be mobile and need a smaller rig, I have an ft-847 in 9.9 condition, and I just cant bring myself to take this jewel mobile with me,its just too nice and expensive of a radio, I would like to trade it for an ft-897 with tuner and maybe one or two battery packs, or maybe the atas antenna system, let me know what you have, the the rig don't have to be the 897 but it is preferred it has to be an H.F./6/2/440 and has to have 100 watts on H.F. and 6 mtr and be able to have split band operation, and be at least as tough as the 897...

let me know what you have, I need to get a deal in the next several days from 10-17-2003 or there will be a perfect ft-847 going mobile, and I would rather not do that.

picture on request.

Much has been written and published on the net on this topic but just to add my two cents and perhaps summarize. I've had good luck with a variable HV DC supply. I bring up the voltage, albeit slowly, while monitoring current with a microamp meter. It's nice to watch the current gradually go lower, then I step up about another 50 volts or so then watch it go lower again until I reach the rated voltage of the cap. I let it "Cook" there for awhile then use the cap. There's a formula for the "Cook Time" based on the age of the cap. Do a net search for that one. Someone in G land I think. I have restored and recapped a lot of older HF radios this way and it has saved me a tremendous amount of cash.The new Electrolytics are a lot smaller/better but we're talking about five bucks each here. I wait till they show up at the Flea Market or local surplus outlet then scoop em up for .25 each. Oooops! Maybe I shouldn't have told you about that.

Hi,

I am searching a low power linear amplifier to work portable, an all bands linear, including WARC, very small and not too heavy.

In the powers ranging between 300-500 watts PEP max, what are the best available brands (and available outside the USA) ?

Subsidiary question, are some of these linears able to work directly on a 12V battery and does it exist automatic models in this range of product ?

Thanks in advance

>12V battery and does it exist automatic models in this range of product ?

Even a 100-watt PEP HF amplifier is probably going to draw 20 amps or
more (peak) from a 12-volt battery. 500 watts PEP might peak out at
around 100 amperes. This is likely to pose a couple of problems...
the battery isn't going to last very long unless it's quite huge, and
(I^2)(R) losses in the wires are going to waste quite a lot of power
and generate a fair bit of heat.

The Ameritron ALS-500M might meet your needs... 500W max PEP, 400W CW,
1.5 - 22 MHz, optional kit extends it to handle 10 and 12 meters,
designed for mobile operations (3.5 x 9 x 15 inches, 7 lbs). It
requires 14 VDC at 80 amps for the finals, 14-16 VDC at 4 amps for the
rest of the circuitry, and somewhat less than 100 watts of exciter
power (for which you'll probably need roughly 15 amps to run your rig).

So, you're talking about a peak current draw of roughly 100 amperes.
A 100-amp-hour deep-cycle battery won't keep you going for very
long... a smaller gel cell would simply go URRGH and collapse instantly.

You might be able to use a deep-cycle battery, connected to and
constantly recharged by a vehicle's alternator. Hardly seems
"portable".

[I haven't used the Ameritron, or in fact any linear amp, so I can't
comment on its quality or reliability.]

Hi,
Indeed ALS-500M is stated as "mobile ampli". This is the only model I think
about, see end of page http://www.astrosurf.com/lombry/qsl-portable3.htm

>
> So, you're talking about a peak current draw of roughly 100 amperes.
> A 100-amp-hour deep-cycle battery won't keep you going for very

Ya, this is the only problem maybe. Even if my starter battery is brand new,
with 400W to pump it will quickly give up the ghost..
Actually, in QSO /P motor stopped, at 100 W I observe that the LCD screen
sometime flicks slighlty...
So at 4-500W it will "Urrgh" as you say :-)

However, I though that there was other or new companies manufacturing low
power (about 500W) amps.
That only proof that my choice my not too bad.
Rest the power it in keeping my car alive to return back home !

Thanks
Thierry

That seems to be the correct explanation, I don't know. This the first time
in +113000 hits on that page that someone complains about a problem...
Will try to get more info.
Thanks.

3789. Question about Icom PS15 power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-18 06:21:37 UTC
From: Michael Herron <Hurricane145@worldnet.att.net>
Message-ID: <RZ4kb.5687$Ec1.500804@bgtnsc05-news.ops.worldnet.att.net>
Source record: 26062

I have an older Icom PS15 power supply. I understand that when you use it with a 706 which I am using, or any of the newer radios designed for it, it should not turn on until the on button on the radio is pushed. This one, when used with the 706, seems to turn on when it is connected to the radio whether the on button is pushed or not. The light comes on and it is running as soon as the power cable is connected to the radio. Is this normal with this radio? I may try my 746 and see what happens with it as well. Could there be a component in the supply that has gone bad causing this? When I first got the supply, there was a switch added to it to turn it on/off manually. Perhaps this is why it was added. I took the switch out and returned it to the original configuration according to the schematic. Any input would be much appreciated. Mike, K7MH. Hurricane145@worldnet.att.net

Internet trials using the electricity power cabling sytem are currently
> undertaken in the USA and european countries like
> Austria, Belgium, France, Germany, Luxembourg and Switzerland
> among others by private and national electricity companies.
> Such trials are in violation of the european directive about the
> "electromagnetic compatibility" (ref. 92/31/EEC handling the famous CE
logo)
> that states that "everybody has the right to use the frequencies at the
> condition to not bother the other users". However, it appears that these
> private or national companies are far to respect this law.
>
> Amateur radio is a service that we pay yearly and as such, if we can not
> practice this activity we should have the right to require an exploitation
> losse.
>
> Unfortunately neither our national representative ham associations (DARC,
> UBA, REF, RSGB, etc) nor the concerned IARU delegation can oppose to this
> criminal practice.
>
> Ham associations have discussed about this problem in the offices of the
> European Commission at Brussels, but without to get the slightest action
or
> result up to day...
> Confronted to such laxities and to lobbies that are standing by, recently
> Hilary, alias G4JKS gave up his fight against administrations, hence the
> publication of this article that the author ask us to publish as often as
> possible on the Internet.

>
> The right technology for the right job, by Peter Cochrane,
> http://www.silicon.com/petercochrane
>
> This document is a reprint from a short article published on Silicon
website
> in which the author reminded how can be hard the fight against
> administrations even when hams rights are derided.
> Here are his commentaries.
>
> For a decade now business plans have arrived on my desk, in increasing
> numbers each year, but only a small percentage find their way to
commercial
> success. Remarkably I see very little correlation between plans.
>
> There is, however, a major exception where the same plan seems to arrive
on
> my desk every year. Each time it is presented as revolutionary and
> ground-breaking. But it is always the same technology and it is always as
> flawed and as misconceived as the original I first saw a decade ago.
> News reports often included to amplify the case are along the following
> lines : XYZ Company is proud to report broadband internet trials are
> underway using a ground-breaking technology that will revolutionise radio,
> TV, cable TV, internet and data services to the home. Existing electricity
> power cable can supply all of your digital services at speeds up to 50
> Mbits. Extensive laboratory trials have proven this technology, and
testing
> with customers is at an early stage. If fully successful a commercial
> rollout is planned within the next three months.
> It is then customary to include a CEO interview that says something along
> the lines of : "All the obstacles have been overcome. The technology is
now
> proven, stable and economically viable, and we are in a position to
> revolutionise the last mile. We also predict this technology will see the
> demise of the telco in the next decade..."
>
> Partner companies usually keep their names secret in anticipation of
further
> announcements to be made later that year and the technical press always
seem
> convinced it is all true. But about 6-12 months after the announcements
the
> companies involved quietly say they are ceasing trials and development
> because some alternative technology has been discovered. It then goes very
> quiet and nothing more is heard.
> I wouldn't find this so upsetting if it only happened once but to my
> knowledge there have been dozens of false dawns. If only the people
involved
> would visit my office I could save them a small fortune. At a modest
> estimate, over $200m has been expended to date and no one has been

> successful in transmitting significant amounts of data over power cables
to
> the home.
>
> I can guarantee no one will get this technology to work as advertised. It
> might be appealing and economically attractive but I'm afraid the basic
laws
> of physics cannot be sidelined. For anyone contemplating the waste of
> another $5-30m here is my 'don't do it' shortlist:
> - Power cables employ low-grade plastic that is unfriendly to
high-frequency
> signals as the absorption per unit length is very high. This alone
precludes
> transmission of high-speed data over significant distances.
> - Power cables are not physically symmetrical and are therefore very
> effective antennas. They radiate energy from high-speed data signals which
> becomes a source of interference for wireless services including broadcast
> radio as well as emergency, maritime, aeronautical, military and
navigation
> services. By reciprocity they also suck in energy from every local radio
> source which further degrades data signals.
> - As signals propagate along cables they become weaker but the switching
> transients from washings machines, refrigerators, vacuum cleaners,
electric
> drills, light switches and other appliances are huge, do not decay at the
> same rate and swamp data signals.
> - Switching transients on power grids with generators going on and off
line,
> dynamic load sharing, fault and maintenance work, all induces massive
> transients that also swamp data signals.
> - Cable joints, transformers, power meters, the on/off nature of
electrical
> appliances and the topology of power grids create large load changes and
> multiple signal reflection points. This creates a dynamic echo environment
> where the transmitted signal is further corrupted.
> - Real time communications of any kind - whether by telephone, radio or
TV -
> are taken out by the huge voltage transients inherent to power lines and
> ultimately the data rates achievable for non-real time are also very low.
> - Transformers and power meters require a workaround as they present an
> absolute block to any high frequency signals.
>
> This is a short disaster list that says this technology will not work. And
> the real nail in the coffin? Telephone and cables were designed to carry
far
> higher frequencies than 50Hz power cables and in every aspect offer
superior
> performance for all data applications. And more recently wireless
technology
> is becoming so low cost and so high performance that signal processing

> requirements for data over power cables, even if it were possible, would
be
> prohibitively expensive in comparison.
>
